- For a short to ground fault, the high beam headlamps and high beam indicator on the instrument cluster are always ON with the headlamp switch in the AUTO or HEAD positions.
- For a short to voltage fault, the high beam headlamps and flash to pass function are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the control circuit terminal 18 and ground.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
3. Vehicle OFF, connect a 3 A fused jumper between the control circuit terminal 18 and ground, vehicle in Service Mode, low beams ON.
4. Verify the high beam headlamps illuminate.
 - **If the high beam headlamps do not illuminate**
 1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal 18 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the high beam headlamps illuminate**
5. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Fuse Block Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B2585 OR B3867: LEFT PARK LAMPS CONTROL CIRCUIT/RIGHT PARK LAMPS CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

1. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamps ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, and license lamps control circuits illuminating the park, tail, and license lamps.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B2585 01 and B2585 04

- The BCM detects a short to voltage or an open/high resistance in the left front park lamp control circuit.
- The BCM detects an open/high resistance in the left front park lamp ground circuit.

DTC B2585 02

The BCM detects a short to ground in the left front park lamp control circuit.

DTC B3867 01 and B3867 04

- The BCM detects a short to voltage or an open/high resistance in the right front park lamp control circuit.
- The BCM detects an open/high resistance in the right front park lamp ground circuit.

DTC B3867 02

The BCM detects a short to ground in the right front park lamp control circuit.

Actions Taken When the DTC Sets

DTC B2585 01

The left front park lamp is always ON.

DTC B2585 02 and B2585 04

The left front park lamp is inoperative.

DTC B3867 01

The right front park lamp is always ON.

DTC B3867 02 and B3867 04

The right front park lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

DTC B2585

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate park lamp listed below.
 - E4AC Park/Daytime Running Lamp - Left
 - E2LF Side Marker Lamp - Left Front
 - E42L Tail Lamp Assembly - Left
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
 - E4AC Park/Daytime Running Lamp - Left terminal 3
 - E2LF Side Marker Lamp - Left Front terminal B

- E42L Tail Lamp Assembly - Left terminal 6
 - **If 10 Ω or greater**
1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
 - E4AC Park/Daytime Running Lamp - Left terminal 2
 - E2LF Side Marker Lamp - Left Front terminal A
 - E42L Tail Lamp Assembly - Left terminal 2
 4. Verify the test lamp turns ON and OFF when commanding the Left Front Park Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 5. Test or replace the left park lamp.

DTC B3867

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate park lamp listed below.
 - E4AD Park/Daytime Running Lamp - Right
 - E2RF Side Marker Lamp - Right Front
 - E42R Tail Lamp Assembly - Right
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
 - E4AD Park/Daytime Running Lamp - Right terminal 3

- E2RF Side Marker Lamp - Right Front terminal B
- E42R Tail Lamp Assembly - Right terminal 6
- **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
- 3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
 - E4AD Park/Daytime Running Lamp - Right terminal 2
 - E2RF Side Marker Lamp - Right Front terminal A
 - E42R Tail Lamp Assembly - Right terminal 2
- 4. Verify the test lamp turns ON and OFF when commanding the Right Front Park Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the right park lamp.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC B2600 OR B2605: LEFT DAYTIME RUNNING LAMPS CONTROL CIRCUIT SHORT TO GROUND/RIGHT DAYTIME RUNNING LAMPS CONTROL CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2600 02

Left Daytime Running Lamps Control Circuit Short to Ground

DTC B2605 02

Right Daytime Running Lamps Control Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Daytime Running Lamp Control - Left	B2600 02	1	1	-
Daytime Running Lamp Control - Right	B2605 02	1	1	-
Daytime Running Lamp Ground - Left	-	1	-	-
Daytime Running Lamp Ground - Right	-	1	-	-
1. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light/sunload sensor is used to monitor outside lighting conditions. The ambient light/sunload sensor provides a serial data message to the body control module (BCM) based on outside lighting conditions to determine if outside lighting conditions are correct for either daytime running lamps or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions the BCM will command the designated daytime running lamps ON. During low light conditions the BCM will command the low beam headlamps ON. Any function or condition that turns on the headlamps will cancel daytime running lamps operation.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B2600 02

The BCM detects a short to ground in the left daytime running lamp control circuit.

DTC B2605 02

The BCM detects a short to ground in the right daytime running lamp control circuit.

Actions Taken When the DTC Sets

DTC B2600 02

The left daytime running lamp is inoperative.

DTC B2605 02

The right daytime running lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

The daytime running lamps will only operate in daylight conditions with the vehicle ON and in any transmission gear except PARK.

Control Module References for scan tool information

Circuit/System Testing

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the inoperative E4A Park/Daytime Running Lamp.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle ON.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Dedicated Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X5 - left daytime running lamp
 - X7 - right daytime running lamp
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle ON.
 - X5 - left daytime running lamp
 - X7 - right daytime running lamp
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
5. Test or replace the appropriate E4A Park/Daytime Running Lamp.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

1. Interior Backlighting Malfunction				

Circuit/System Description

The headlamp switch is used to increase and decrease the brightness of the interior backlighting components. The headlamp switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a B+, low reference, and signal circuits to the headlamp switch. When the headlamp switch is placed in the desired position, the dimmed voltage setting is applied from the headlamp switch through the headlamp switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B2610 01

The BCM detects a short to battery in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

DTC B2610 02

The BCM detects a short to ground in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

DTC B2610 04

The BCM detects an open/high resistance in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

Actions Taken When the DTC Sets

The BCM will disable the LED backlight dimming control circuits.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

NOTE: Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Backlighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the appropriate ground circuit terminal and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

3. Connect a test lamp between the appropriate control circuit terminal and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X2 terminal 8
 - X7 terminal 9
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode
 - X2 terminal 8
 - X7 terminal 9
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

5. Test or replace the component with inoperative backlighting.

DTC B2615: PASSENGER COMPARTMENT DIMMING 2 CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC B2615 02

Passenger Compartment Dimming 2 Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F5DA (BCM 2) Fuse B+	B270A 01, B2615 02	B270A 01, B2615 02	-	-
Accent Lamp Control - Terminal 5 X2	B270A 01, B2615 02	1	1	-
Dome Lamps Control - Terminal 1 X7	B270A 01, B2615 02	1	1	-
Accent Lamp Ground - Instrument Panel	-	1	-	-
Dome/Reading Lamps - Front Ground	-	1	-	-
Dome/Reading Lamps - Rear Ground	-	1	-	-
1. Dome Lamps Malfunction				

Circuit/System Description

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door-open input. The BCM illuminates the dome lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps will remain illuminated approximately 3 seconds after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome lamps will be disabled. In the event that the dome lamps were to remain illuminated for more

than 10 minutes with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the dome lamps control circuit to prevent total battery discharge.

Conditions for Running the DTC

Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

- The BCM detects a short to ground in the dome lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the F5DA (BCM 2) fuse B+ circuit.

Actions Taken When the DTC Sets

The front and middle dome lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

When the F5DA (BCM 2) fuse is open, both dome lamps, sunshade lamps, reading lamps, and backup lamps will be inoperative. DTC B2545 will also set for the backup lamps when the vehicle is placed in the reverse gear.

Control Module References for scan tool information

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the inoperative component listed below. It may take up to 2 min for all vehicle systems to power down.
 - S48B Multifunction Switch - Overhead Console
 - E37R Dome/Reading Lamps - Rear
 - E1W Accent Lamp - Instrument Panel
5. Test for less than 5 Ω between the ground circuit terminals listed below and ground.
 - S48B Multifunction Switch - Overhead Console terminal 5
 - E37R Dome/Reading Lamps - Rear terminal B
 - E1W Accent Lamp - Instrument Panel terminal 2
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuits end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
6. Connect a test lamp between the control circuit terminals listed below and ground.
 - S48B Multifunction Switch - Overhead Console terminal 8
 - E37R Dome/Reading Lamps - Rear terminal C
 - E1W Accent Lamp - Instrument Panel terminal 1
7. Verify the test lamp turns ON and OFF when commanding the Courtesy Lamps ON and OFF with a scan

tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.

- X7 - S48B Multifunction Switch - Overhead Console and E37R Dome/Reading Lamps - Rear
- X2 - E1W Accent Lamp - Instrument Panel

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode.

- X7 - S48B Multifunction Switch - Overhead Console and E37R Dome/Reading Lamps - Rear
- X2 - E1W Accent Lamp - Instrument Panel

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

8. Test or replace the inoperative dome/reading lamp.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

1. Interior Backlighting Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the amber switch indicators through the amber LED indicator control circuit. When the appropriate switch has been activated, the BCM applies a pulse width modulated voltage through the amber LED indicator control circuit illuminating the rear seat heating switches, overhead console multifunction switch, and center console multifunction switch amber LEDs.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Park lamps ON.

Conditions for Setting the DTC

The BCM detects a short to ground in the switch indicator LED backlight dimming control circuit terminal 5 X1.

Actions Taken When the DTC Sets

The switch indicator LED backlight dimming control circuit terminal 5 X1 driver is shut down.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connectors at the components listed below.

- S32LR Seat Heating Switch - Left Rear
- S32RR Seat Heating Switch - Right Rear
- S48B Multifunction Switch - Overhead Console
- S48E Multifunction Switch - Center Console

NOTE: **The test lamp in the following step will illuminate at LOW intensity. This is normal circuit operation and does not indicate a circuit malfunction.**

2. Vehicle in Service Mode, verify a test lamp illuminates between each control circuit terminal listed below and ground.

- S32LR Seat Heating Switch - Left Rear terminal 6
- S32RR Seat Heating Switch - Right Rear terminal 6
- S48B Multifunction Switch - Overhead Console terminal 18
- S48E Multifunction Switch - Center Console terminal 3
- **If the test lamp does not illuminate**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp illuminates**

3. Verify a test lamp does not illuminate at FULL intensity between each control circuit terminal listed below and ground.

- S32LR Seat Heating Switch - Left Rear terminal 6
- S32RR Seat Heating Switch - Right Rear terminal 6
- S48B Multifunction Switch - Overhead Console terminal 18
- S48E Multifunction Switch - Center Console terminal 3

- **If the test lamp illuminates at FULL intensity**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp does not illuminate at FULL intensity**

4. Test or replace the component with the inoperative switch indicator.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Headlamp Switch Replacement](#)
- Refer to [Control Module References](#) for BCM replacement, programming, and setup

DTC B3596: HAZARD LAMPS REQUEST CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3596 00

Hazard Lamps Request Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Warning Switch Signal	B3596 00	1	1	-
Hazard Warning Switch Ground	-	1	-	-
1. Hazard Lamps Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Hazard lamps ON.

Conditions for Setting the DTC

The hazard warning switch input is Active for longer than 60 s.

Actions Taken When the DTC Sets

The hazard lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S26 Hazard Warning Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 1 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Hazard Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.
6. Verify the scan tool Hazard Lamps Switch parameter is Active.
 - **If not Active**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If Active**
7. Test or replace the S26 Hazard Warning Switch.

Headlamp Switch Low Reference	1	1	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides B+, low reference, and signal circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B3600 03

- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch B+ reference circuit.

- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch signal circuit.

DTC B3600 07

- The BCM detects a short to voltage in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to voltage in the instrument panel dimmer switch signal circuit.

Actions Taken When the DTC Sets

All interior backlighting defaults to FULL bright.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S30 Headlamp Switch, vehicle in Service Mode.
2. Test for B+ between the B+ circuit terminal 12 and ground.
 - **If less than B+**
 1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in

Service Mode.

2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

• **If B+**

3. Test for B+ between the B+ circuit terminal 12 and the low reference circuit terminal 7.

• **If less than B+**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the low reference circuit terminal 7 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

• **If B+**

4. Verify a test lamp does not illuminate between the B+ circuit terminal 12 and the signal circuit terminal 11.

• **If the test lamp illuminates**

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

• **If the test lamp does not illuminate**

5. Test for B+ between the B+ circuit terminal 12 and the signal circuit terminal 11.

• **If less than B+**

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit terminal 11 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

• **If B+**

6. Test or replace the S30 Headlamp Switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC B3650: HIGH BEAM REQUEST SIGNAL CIRCUIT PERFORMANCE - SIGNAL INVALID

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3650 08

High Beam Request Signal Circuit Performance - Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Turn Signal/Multifunction Switch Flash To Pass Signal	B3806 00	1	1	-
Turn Signal/Multifunction Switch High Beam Signal	B3650 08	1	1	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

For headlamp operation, the body control module (BCM) monitors three signal circuits from the turn signal/multifunction switch. When the turn signal/multifunction switch is in the AUTO position, the three signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRLs) ON and OFF. When the turn signal/multifunction switch is placed in the OFF position, the turn signal/multifunction switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the turn signal/multifunction switch in the PARK LAMPS position, the turn signal/multifunction switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the turn signal/multifunction switch is in the HEADLAMP position, both the turn signal/multifunction switch park lamps ON signal circuit and the turn signal/multifunction switch headlamps ON signal circuit are grounded. The BCM responds by commanding the park lamps and headlamps ON.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch high beam signal circuit.

Actions Taken When the DTC Sets

The high beam headlamps will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

DTC B3806: HIGH BEAM AND HEADLAMP FLASH SELECT CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3806 00

High Beam and Headlamp Flash Select Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Turn Signal/Multifunction Switch Flash To Pass Signal	B3806 00	1	1	-
Turn Signal/Multifunction Switch High Beam Signal	B3650 08	1	1	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the body control module (BCM) through the flash to pass signal circuit. The BCM responds to the flash to pass request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps. The high beam headlamps will only illuminate for as long as the flash to pass switch is activated.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch flash to pass signal circuit.

Actions Taken When the DTC Sets

The high beam lamps and the high beam indicator on the instrument panel cluster are always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Headlamp Switch Ground	-	1	-	-
Stop Lamp Ground - Left	-	1	-	-
Stop Lamp Ground - Right	-	1	-	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits illuminating the left and right stop lamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Stop lamps ON.

Conditions for Setting the DTC

DTC B3881 01 and B3881 04

The BCM detects a short to voltage or an open/high resistance in the left rear stop lamp control circuit.

DTC B3881 02

The BCM detects a short to ground in the left rear stop lamp control circuit.

DTC B3882 01 and B3882 04

The BCM detects a short to voltage or an open/high resistance in the right rear stop lamp control circuit.

DTC B3882 02

The BCM detects a short to ground in the right rear stop lamp control circuit.

Actions Taken When the DTC Sets

DTC B3881 01

The left rear stop lamp is always ON.

DTC B3881 02 and B3881 04

The left rear stop lamp is inoperative.

DTC B3882 01

The right rear stop lamp is always ON.

DTC B3882 02 and B3882 04

The right rear stop lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

1. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the turn signal/multifunction switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps and license lamps control circuits illuminating the park and license lamps.

Conditions for Running the DTC

DTC B3883 01

Turn signal/multifunction switch in OFF position.

DTC B3883 02 and B3883 04

Turn signal/multifunction switch in AUTO, PARK or ON positions.

Conditions for Setting the DTC

DTC B3883 01

The BCM detects a short to voltage in the license plate lamp control circuit.

DTC B3883 02

The BCM detects a short to ground in the license plate lamp control circuit.

DTC B3883 04

The BCM detects an open/high resistance in the license plate lamp control circuit.

Actions Taken When the DTC Sets

DTC B3883 01

License plate lamps always ON.

DTC B3883 02 and B3883 04

License plate lamps inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 5. Vehicle OFF.
 6. Connect a test lamp between the E7R License Plate Lamp - Right control circuit terminal 1 and ground, vehicle in Service Mode.
 7. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - **If the test lamp turns ON and OFF**
 8. Test or replace the E7 License Plate Lamp bulb.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Rear License Plate Lamp Replacement](#)

- Refer to [Control Module References](#) for BCM replacement, programming, and setup

DTC B3884: CENTER HIGH MOUNTED STOP LAMP CIRCUIT

Diagnostic Instructions

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Center High Mounted Stop Lamp Control	B3884 02	B3884 04	B3884 01	-
Center High Mounted Stop Lamp Ground	-	1	-	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp control circuit illuminating the left and right stop lamps and the center high mounted stop lamp.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

DTC B3884 01

The BCM detects a short to voltage in the center high mounted stop lamp control circuit.

DTC B3884 02

The BCM detects a short to ground in the center high mounted stop lamp control circuit.

DTC B3884 04

The BCM detects an open/high resistance in the center high mounted stop lamp control circuit.

Actions Taken When the DTC Sets

DTC B3884 01

Center high mounted stop lamp always ON.

DTC B3884 02 and B3884 04

Center high mounted stop lamp inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be

activated with the vehicle ON/OFF switch in the SERVICE MODE or ON positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument panel requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B3948 01 and B3948 04

- The BCM detects a short to ground or an open/high resistance in the F18DA (BCM 7) fuse B+ circuit.
- The BCM detects an open/high resistance in the left front turn signal control circuit.
- The BCM detects an open/high resistance in the left front turn signal ground circuit.

DTC B3948 02

The BCM detects a short to ground in the left front turn signal control circuit.

DTC B3949 01 and B3949 04

- The BCM detects a short to ground or an open/high resistance in the F8DA (BCM 3) fuse B+ circuit.
- The BCM detects an open/high resistance in the right front turn signal control circuit.
- The BCM detects an open/high resistance in the right front turn signal ground circuit.

DTC B3949 02

The BCM detects a short to ground in the right front turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3948

- The left front turn signal is inoperative.
- The left turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Left Front Turn Indicator Failure".

DTC B3949

- The right front turn signal is inoperative.
- The right turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Right Front Turn Indicator Failure".

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.

- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

DTC B3948

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**

3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Exterior lamps OFF, disconnect the harness connectors at the E4LF Turn Signal Lamp - Left Front.
5. Test for less than 10 Ω between the ground circuit at the socket terminal and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the E4LF Turn Signal Lamp - Left Front.

DTC B3949

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.

- **If the test lamp illuminates**

3. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Exterior lamps OFF, disconnect the harness connector at the component E4RF Turn Signal Lamp - Right Front.
5. Test for less than 10 Ω between the ground circuit at the socket terminal and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Right Front Turn Signal Lamp ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

8. Test or replace the E4RF Turn Signal Lamp - Right Front.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the vehicle ON/OFF switch in the SERVICE MODE or ON positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument panel requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B3950 01 and B3950 04

- The BCM detects a short to ground or an open/high resistance in the F21DA (BCM 4) fuse B+ circuit.
- The BCM detects an open/high resistance in the left rear turn signal control circuit.
- The BCM detects an open/high resistance in the left rear turn signal ground circuit.

DTC B3950 02

The BCM detects a short to ground in the left rear turn signal control circuit.

DTC B3951 01 and B3951 04

- The BCM detects a short to ground or an open/high resistance in the F18DA (BCM 7) fuse B+ circuit.
- The BCM detects an open/high resistance in the right rear turn signal control circuit.
- The BCM detects an open/high resistance in the right rear turn signal ground circuit.

DTC B3951 02

The BCM detects a short to ground in the right rear turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3950

- The left rear turn signal is inoperative.
- The left turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Left Rear Turn Indicator Failure".

DTC B3951

- The right rear turn signal is inoperative.
- The right turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Right Rear Turn Indicator Failure".

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

DTC B3950

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.

- **If the test lamp illuminates**

3. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Exterior lamps OFF, disconnect the harness connector at the E4LR Turn Signal Lamp - Left Rear.
5. Test for less than 5 Ω between the ground circuit at the socket terminal and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Left Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

8. Test or replace the E4LR Turn Signal Lamp - Left Rear.

DTC B3951

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.

2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If the test lamp illuminates**

3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.

4. Exterior lamps OFF, disconnect the harness connector at the E4RR Turn Signal Lamp - Right Rear.

5. Test for less than 5 Ω between the ground circuit at the socket terminal and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.

7. Verify the test lamp turns ON and OFF when commanding the Right Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
- **If the test lamp turns ON and OFF**
8. Test or replace the E4RR Turn Signal Lamp - Right Rear.

Brake Pedal Position Sensor Low Reference	-	1	1	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

DTC C0277 06

- The BCM detects a short to ground or an open/high resistance in the BPP sensor 5 V reference circuit.
- The BCM detects a short to ground or an open/high resistance in the BPP sensor signal circuit.

DTC C0277 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor signal circuit.

DTC C0277 09

The BCM detects the BPP sensor signal is changing faster than possible under normal operating conditions.

DTC C0277 4B

The DTC will set when the BPP sensor home position is not learned.

DTC C0890 03

- The BCM detects a short to ground or an open/high resistance in the BPP sensor 5 V reference circuit.

DTC C0890 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor signal circuit.

Actions Taken When the DTC Sets

DTC C0277 06 and C0890 03

- The vehicle will not start with a short to ground or an open/high resistance on the BPPS 5 V reference circuit or the BPPS signal circuit.

DTC C0277 07 and C0890 07

The vehicle will not start with a short to voltage on the BPPS 5 V reference circuit or the BPPS signal circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- For DTC C0277 4B a successful brake pedal position sensor calibration has been performed.
- A history DTC will clear once 50 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.
- A DTC will not clear the current status until the next ignition cycle.

DTC C0277 06, C0277 07, C0890 03, and C0890 07

1. Vehicle OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, vehicle in Service Mode.
2. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If between 4.8 - 5.2 V**
3. Verify the scan tool Brake Pedal Applied parameter is Inactive.
 - **If not Inactive**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If Inactive**
4. Install a 3 A fused jumper wire between the 5-volt reference circuit terminal 1 and the signal circuit terminal 3.
5. Verify the scan tool Brake Pedal Applied parameter is Active.
 - **If not Active**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

6. Test or replace the B22 Brake Pedal Position Sensor.

DTC C0277 4B

1. Verify DTC C0277 4B is not set.

- **If DTC C0277 4B is set**

1. Vehicle in Service Mode.

2. Perform the BPP sensor recalibration procedure for the K9 Body Control Module. Refer to [Brake Pedal Position Sensor Calibration](#).

3. Verify the DTC does not reset while operating the vehicle under the conditions for running the DTC.

- If the DTC resets, replace the B22 Brake Pedal Position Sensor.
- If the DTC does not reset

4. All OK.

- **If DTC C0277 4B is not set**

2. All OK.

DTC C0277 09

1. Verify DTC C0277 09 is not set.

- **If DTC C0277 09 is set**

1. Replace the B22 Brake Pedal Position Sensor.

2. Perform the BPP sensor recalibration procedure for the K9 Body Control Module. Refer to [Brake Pedal Position Sensor Calibration](#).

3. Verify the DTC does not reset while operating the vehicle under the conditions for running the DTC.

- If the DTC resets, replace the K9 Body Control Module.
- If the DTC does not reset

4. All OK.

- **If DTC C0277 09 is not set**

2. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Brake Pedal Position Sensor Calibration](#)
- Refer to [Brake Pedal Position Sensor Replacement](#)
- Refer to [Control Module References](#) for BCM replacement, programming, and setup

DTC C0297: BRAKE APPLIED OUTPUT CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0297 02

Brake Applied Output Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Applied Signal	C0297 02	1	1	-
1. Cruise Control Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the right and left stop lamp control circuits, engine control module (ECM), and center high mounted stop lamp control circuit.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

The BCM detects a short to ground or an open/high resistance on the brake applied signal circuit.

Actions Taken When the DTC Sets

The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

Verify that the brake pedal position sensor is properly calibrated.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Connect a test lamp between the signal circuit terminal 50 and ground, vehicle in Service Mode.
3. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**

4. Replace the K20 Engine Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Brake Pedal Position Sensor Calibration](#)
- Refer to [Control Module References](#) for BCM or ECM replacement, programming, and setup

SYMPTOMS - LIGHTING

NOTE: The following steps must be completed before using a symptom table.

- Perform the [Diagnostic System Check - Vehicle](#) before using a symptom table in order to verify that all of the following conditions are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
- Review the system description and operation in order to familiarize yourself with the system functions. Refer to the following:
 - [Exterior Lighting Systems Description and Operation](#)
 - [Interior Lighting Systems Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the lighting system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Thoroughly inspect the wiring and connectors. An incomplete inspection of the wiring and connectors may result in misdiagnosis causing part replacement with the reappearance of the malfunction. If an intermittent malfunction exists, refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Backup Lamps Malfunction](#)
- [Courtesy Lamps Malfunction](#)
- [Daytime Running Lamps Malfunction](#)
- [Dome Lamps Malfunction](#)
- [Hazard Lamps Malfunction](#)
- [Headlamps Malfunction](#)
- [Interior Accent Lighting Malfunction](#)
- [Interior Backlighting Malfunction](#)

- [Park, License, and/or Tail Lamps Malfunction](#)
- [Rear Compartment Lamp Malfunction](#)
- [Stop Lamps Malfunction](#)
- [Turn Signal Lamps and/or Indicators Malfunction](#)

BACKUP LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F22DA (BCM 6) Fuse B+	1	1	-	-
Backup Lamp Control	B2545 02	1	1	-
Backup Lamp Ground	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

With the vehicle ON and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamp control circuit illuminating the backup lamp. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamp control circuit. The vehicle must be ON for the backup lamps to operate.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E5 Backup Lamp.
5. Test for less than 5 Ω between the ground circuit at the socket terminal and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
- **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the E5 Backup Lamp.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Backup Lamp Bulb Replacement](#)
- Refer to [Control Module References](#) for BCM replacement, programming, and setup

COURTESY LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F22DA (BCM 6) Fuse B+	1	1	-	-
Courtesy Lamps Control - Terminal 3 X7	B1480 02	1	1	-
Dome/Reading Lamps - Front Ground	-	1, 2	-	-
Dome/Reading Lamps - Rear Ground	-	1, 2	-	-
Sunshade Mirror Lamp - Left Ground	-	1	-	-
Sunshade Mirror Lamp - Right Ground	-	1	-	-
1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to the front reading lamps and left and right sunshade lamps via the courtesy lamp control circuit. When a sunshade mirror is opened, the switch contact close allowing battery voltage to flow illuminating the respective lamps. The front reading lamps are controlled by individual switches that are activated by the operator when additional cabin lighting is required. In the event that any of these courtesy lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

Diagnostic Aids

When the F22DA (BCM 6) fuse is open, both dome lamps, sunshade lamps, reading lamps, and backup lamps will be inoperative.

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
 4. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connectors at the components listed below. It may take up to 2 min for all vehicle systems to power down.
 - S48B Multifunction Switch - Overhead Console
 - E37R Dome/Reading Lamps - Rear
 - E31L Sunshade Mirror Lamp - Left
 - E31R Sunshade Mirror Lamp - Right
 5. Test for less than 15 Ω between the appropriate ground circuit terminal listed below and ground.
 - S48B Multifunction Switch - Overhead Console terminal 5
 - E37R Dome/Reading Lamps - Rear terminal B
 - E31L Sunshade Mirror Lamp - Left terminal B
 - E31R Sunshade Mirror Lamp - Right terminal B
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
 6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
 - S48B Multifunction Switch - Overhead Console terminal 7
 - E37R Dome/Reading Lamps - Rear terminal A
 - E31L Sunshade Mirror Lamp - Left terminal A
 - E31R Sunshade Mirror Lamp - Right terminal A
 7. Verify the test lamp turns ON and OFF when commanding the Inadvertent Load ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.
- **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
- **If the test lamp turns ON and OFF**
 8. Test or replace the appropriate courtesy lamp.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Sunshade Illuminated Mirror Lamp Bulb Replacement](#)
- Refer to [Center Reading Lamp Replacement](#)
- Refer to [Control Module References](#) for BCM replacement, programming, and setup

DAYTIME RUNNING LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F20DA Fuse (BCM 1) Fuse B+	B0968 06, B1517 07	B0968 06, B1517 07	-	-

Daytime Running Lamp Ground - Left	-	1	-	-
Daytime Running Lamp Ground - Right	-	1	-	-
1. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light/sunload sensor is used to monitor outside lighting conditions. The ambient light/sunload sensor provides a serial data message to the body control module (BCM) based on outside lighting conditions to determine if outside lighting conditions are correct for either daytime running lamps or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions the BCM will command the designated daytime running lamps ON. During low light conditions the BCM will command the low beam headlamps ON. Any function or condition that turns on the headlamps will cancel daytime running lamps operation.

Diagnostic Aids

The daytime running lamps will only operate in daylight conditions with the vehicle ON and in any transmission gear except PARK.

Circuit/System Verification

1. Vehicle ON.
2. Verify the left daytime running lamp turns ON and OFF when commanding the Left Dedicated Daytime Running Lamp ON and OFF with a scan tool.

- **If the left daytime running lamp does not turn ON and OFF**

Refer to Daytime Running Lamp Malfunction.

- **If the left daytime running lamp turns ON and OFF**

3. Verify the right daytime running lamp turns ON and OFF when commanding the Right Dedicated

Daytime Running Lamp ON and OFF with a scan tool.

- **If the right daytime running lamp does not turn ON and OFF**

Refer to Daytime Running Lamp Malfunction.

- **If the right daytime running lamp turns ON and OFF**

4. Refer to [DTC U1340-U135F](#) .

Circuit/System Testing

Daytime Running Lamp Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
5. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
6. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
7. Exterior lamps OFF, disconnect the harness connector at the inoperative E4 Daytime Running Lamp.
8. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
- **If less than 10 Ω**
9. Connect a test lamp between the control circuit terminal 1 and ground, vehicle ON.
10. Verify the test lamp turns ON and OFF when commanding the appropriate Dedicated Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X5 - left daytime running lamp
 - X7 - right daytime running lamp
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle ON.
 - X5 - left daytime running lamp
 - X7 - right daytime running lamp
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
11. Test or replace the appropriate E4 Daytime Running Lamp.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F5DA (BCM 2) Fuse B+	B270A 01, B2615 02	B270A 01, B2615 02	-	-
Dome Lamps Control - Terminal 1 X7	B270A 01, B2615 02	1	1	-
Accent Lamp Control - Terminal 5 X2	B270A 01, B2615 02	1	1	-
Dome Lamp Switch Cancel Signal	2	2	2	-
Dome Lamp Switch ON Signal	2	2	2	-
Accent Lamp Ground - Instrument Panel	-	1	-	-
Dome Lamp Ground - Front	-	1, 2	-	-
Dome Lamp Ground - Rear	-	1	-	-
1. Dome Lamps Malfunction 2. Dome Lamp Switch Malfunction				

Circuit/System Description

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door-open input. The BCM illuminates the dome lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps will remain illuminated approximately 3 seconds after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome lamps will be disabled. In the event that the dome lamps were to remain illuminated for more than 10 minutes with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the dome lamps control circuit to prevent total battery discharge.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Door Ajar Sw. parameter changes between Active and Inactive while opening and closing each vehicle door.
 - **If the parameter does not change**

Refer to [Door Ajar Indicator Malfunction](#) .
 - **If the parameter changes**
3. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter changes between Door, On, and Cancel while placing the dome lamp switch in the Door, On, and Cancel positions.
 - **If the parameter does not change**

Refer to Dome Lamp Switch Malfunction.
 - **If the parameter changes**
4. Verify the dome lamps turn ON and OFF while commanding the Courtesy Lamps ON and OFF with a scan tool.
 - **If the dome lamps do not turn ON and OFF**

Refer to Dome Lamp Malfunction.
 - **If the dome lamps turn ON and OFF**
5. All OK.

Circuit/System Testing

Dome Lamp Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 5 and ground.
 - **If 5 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
- **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Door.
 - **If Cancel**
 1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 21 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If On**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Door**
5. Install a 3 A fused jumper wire between the signal circuit terminal 21 and the ground circuit terminal 6.
6. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Cancel.
 - **If not Cancel**
 1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 21 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If Cancel**
7. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 6.
8. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is On.
 - **If not On**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If On**

9. Test or replace the E37F Dome/Reading Lamps - Front.

Dome Lamps Malfunction

- Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the inoperative component listed below. It may take up to 2 min for all vehicle systems to power down.
 - S48B Multifunction Switch - Overhead Console
 - E37R Dome/Reading Lamps - Rear
 - E1W Accent Lamp - Instrument Panel
- Test for less than 5 Ω between the ground circuit terminals listed below and ground.
 - S48B Multifunction Switch - Overhead Console terminal 5
 - E37R Dome/Reading Lamps - Rear terminal B
 - E1W Accent Lamp - Instrument Panel terminal 2
 - **If 5 Ω or greater**
 - Vehicle OFF.
 - Test for less than 2 Ω in the ground circuits end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
- Connect a test lamp between the control circuit terminals listed below and ground, vehicle in Service Mode.
 - S48B Multifunction Switch - Overhead Console terminal 8
 - E37R Dome/Reading Lamps - Rear terminal C
 - E1W Accent Lamp - Instrument Panel terminal 1
- Verify the test lamp turns ON and OFF when commanding the Courtesy Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X7 - S48B Multifunction Switch - Overhead Console and E37R Dome/Reading Lamps - Rear
 - X2 - E1W Accent Lamp - Instrument Panel
 - Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode.

- X7 - S48B Multifunction Switch - Overhead Console and E37R Dome/Reading Lamps - Rear
- X2 - E1W Accent Lamp - Instrument Panel

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

5. Test or replace the inoperative dome lamp.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Center Reading Lamp Replacement](#)
- Refer to [Front Floor Console Bin Lamp Replacement](#)
- Refer to [Control Module References](#) for BCM replacement, programming, and setup

HAZARD LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F20DA (BCM 1) Fuse B+	B0968 06, B1517 07	B0968 06, B1517 07	-	-
Hazard Warning Switch Signal	B3596 00	1	1	-
Hazard Warning Switch LED Backlighting Control	2	2	2	-
Hazard Warning Switch Ground	-	1	-	-
1. Hazard Lamps Malfunction 2. Hazard Warning Switch Backlighting Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is

momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Hazard Lamps Switch parameter changes between Active and Inactive while commanding the hazard lamps ON and OFF with the hazard warning switch.
 - **If the parameter does not change**

Refer to Hazard Warning Switch Malfunction.
 - **If the parameter changes**
3. Verify all left and right turn signal lamps turn ON and OFF while commanding the hazard lamps ON and OFF with the hazard warning switch.
 - **If all turn signal lamps do not turn ON and OFF**

Refer to [Turn Signal Lamps and/or Indicators Malfunction](#)
 - **If all turn signal lamps turn ON and OFF**
4. Verify the scan tool Hazard Lamps Switch backlighting turns ON and OFF while commanding the Hazard

Lamps Switch Backlight ON and OFF with a scan tool.

- **If the hazard warning switch backlighting does not turn ON and OFF**

Refer to Hazard Warning Switch Backlighting Malfunction.

- **If the hazard warning switch backlighting turns ON and OFF**

5. All OK.

Circuit/System Testing

Hazard Warning Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S26 Hazard Warning Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 1 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Hazard Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground terminal 1.
6. Verify the scan tool Hazard Lamps Switch parameter is Active.
 - **If not Active**
 1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If Active**

7. Test or replace the S26 Hazard Warning Switch.

Hazard Warning Switch Backlighting Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S26 Hazard Warning Switch. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 5 Ω between the ground circuit terminal 1 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
6. Vehicle in Service Mode, test for B+ between the control circuit terminal 2 and ground.
 - **If less than B+**
 1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If B+**
7. Verify a test lamp does not illuminate between control circuit terminal 2 and ground.
 - **If the test lamp illuminates**
 1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in

Service Mode.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp does not illuminate**

8. Test or replace the S26 Hazard Warning Switch.

Circuit/System Description

For headlamp operation, the body control module (BCM) monitors 3 signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, the 3 signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRLs) ON and OFF. When the headlamp switch is placed in the OFF position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK LAMPS position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds by commanding the park lamps and headlamps ON.

The high beam and flash to pass functions are contained within the turn signal/multifunction switch. The BCM provides the turn signal/multifunction switch with 2 signal circuits, the high beam signal circuit and the flash to pass signal circuit. When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps.

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the BCM through the flash to pass signal circuit. The BCM responds by applying ground to the high beam relay control circuit which energizes the high beam relay illuminating the high beams for a brief moment or until the flash to pass switch is released.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Headlamps On Switch parameter changes between Active and Inactive while commanding the headlamps ON and OFF with the Headlamp Switch.
 - **If the parameter does not change**

Refer to Headlamp Switch Malfunction.
 - **If the parameter changes**
3. Verify the scan tool Automatic Headlamps Disable Switch parameter changes between Active and Inactive while commanding the automatic lamp control ON and OFF with the Headlamp Switch.
 - **If the parameter does not change**

Refer to Headlamp Switch Malfunction.
 - **If the parameter changes**
4. Verify the scan tool Headlamps Flash Switch parameter changes between Active and Inactive while commanding the flash to pass ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Turn Signal/Multifunction Switch Malfunction.
 - **If the parameter changes**
5. Verify the scan tool High Beam Select Switch parameter changes between Active and Inactive while commanding the high beams ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Turn Signal/Multifunction Switch Malfunction.
 - **If the parameter changes**
6. Verify the left low beam headlamp lamp turns ON and OFF when commanding the Left Headlamp Low Beam ON and OFF with a scan tool.
 - **If the left low beam headlamp does not turn ON and OFF**

Refer to Headlamps Malfunction - Low Beam.

- **If the left low beam headlamp turns ON and OFF**

7. Verify the right low headlamp turns ON and OFF when commanding the Right Headlamp Low Beam ON and OFF with a scan tool.

- **If the right low beam headlamp does not turn ON and OFF**

Refer to Headlamps Malfunction - Low Beam.

- **If the right low beam headlamp turns ON and OFF**

8. Low beam headlamps ON, verify the high beams turn ON and OFF when commanding the High Beams ON and OFF with a scan tool.

- **If the high beams do not turn ON and OFF**

Refer to Headlamps Malfunction - High Beam.

- **If the high beams turn ON and OFF**

9. Verify the high beam indicator on the instrument cluster turns ON and OFF while commanding the All Indicators Test ON and OFF with a scan tool.

- **If the high beam indicator does not turn ON and OFF**

Refer to High Beam Indicator Malfunction.

- **If the high beam indicator turns ON and OFF**

10. (TQ5 only) Verify the scan tool Auto High Beam Select Switch parameter changes between Active and Inactive while commanding the auto high beams ON and OFF with the turn signal/multifunction switch.

- **If the parameter does not change**

Refer to Automatic High Beam Select Switch Malfunction.

- **If the parameter changes**

11. All OK.

Circuit/System Testing

Headlamp Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the ground circuit terminal 8 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Verify the scan tool Automatic Headlamps Disable Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 3 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.

6. Verify the scan tool Automatic Headlamps Disable Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit terminal 3 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

7. Verify the scan tool Park Lamps Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

8. Install a 3 A fused jumper wire between the signal circuit terminal 5 and ground.

9. Verify the scan tool Park Lamps Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit terminal 5 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

10. Verify the scan tool Headlamps On Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 1 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

11. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.

12. Verify the scan tool Headlamps On Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit terminal 1 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

13. Test or replace the S30 Headlamp Switch.

Turn Signal/Multifunction Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the ground circuit terminal 3 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Verify the scan tool High Beam Select Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 7 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 7 and ground.
6. Verify the scan tool High Beam Select Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 7 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

7. Verify the scan tool Headlamps Flash Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the signal circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

8. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
9. Verify the scan tool Headlamps Flash Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 6 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

10. Test or replace the S78 Turn Signal/Multifunction Switch.

Automatic High Beam Select Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 3 and ground.

- **If 5 Ω or greater**

1. Ignition OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

3. Ignition ON.
4. Verify the scan tool Auto High Beam Select Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground.
6. Verify the scan tool Auto High Beam Select Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If Active**
7. Test or replace the S78 Turn Signal/Multifunction Switch.

Headlamps Malfunction - Low Beam

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module
 - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module
 - **If the test lamp illuminates**
 4. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
 5. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E4 Headlamp - Low Beam.
 6. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
 7. Connect a test lamp between the control circuit terminal 4 and ground, vehicle in Service Mode.
 8. Verify the test lamp turns ON and OFF when commanding the appropriate Headlamp Low Beam ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

9. Test or replace the E4 Headlamp - Low Beam.

Headlamps Malfunction - High Beam

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Verify a test lamp illuminates between the control circuit terminal 18 and ground.

- **If the test lamp does not illuminate**

1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.

2. Test for infinite resistance between the control circuit terminal and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the X50A Fuse Block - Underhood.

- **If the test lamp illuminates**

3. Vehicle OFF, connect a 3 A fused jumper between the control circuit terminal 18 and ground.

4. Remove the left high beam fuse (F37UA) at the X50A Fuse Block - Underhood, vehicle in Service Mode.

5. Verify a test lamp illuminates between the left high beam fuse (F37UA) B+ switch control terminal and ground.

- **If the test lamp does not illuminate**

1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.

2. Test for less than 1 V between the control circuit terminal 18 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the X50A Fuse Block - Underhood.

- **If the test lamp illuminates**

6. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.

7. Install the left high beam fuse (F37UA) at the X50A Fuse Block - Underhood.

8. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E4 Headlamp - High Beam.

9. Test for less than 10 Ω between the ground circuit terminal B and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

10. Connect a test lamp between the control circuit terminal A and ground, vehicle in Service Mode.

11. Verify the test lamp turns ON and OFF when commanding the High Beams ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the X50A Fuse Block - Underhood.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the X50A Fuse Block - Underhood.

- **If the test lamp turns ON and OFF**

12. Test or replace the E4 Headlamp - High Beam.

High Beam Indicator Malfunction

1. Vehicle in Service Mode.

2. Verify the high beam indicator turns ON and OFF when commanding the Instrument Cluster All Indicators Test ON and OFF with a scan tool.

- **If the high beam indicator is always OFF or remains ON**

Replace the P16 Instrument Cluster.

- **If the high beam indicator turns ON and OFF**

3. Replace the K9 Body Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Headlamp Replacement](#)

1. Interior Accent Lighting Malfunction				

Circuit/System Description

The headlamp switch is used to increase and decrease the brightness of the interior backlighting components. The headlamp switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides B+, signal, and low reference circuits to the headlamp switch. When the headlamp switch is placed in the desired position, the dimmed voltage setting is applied from the headlamp switch through the headlamp switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Circuit/System Testing

NOTE: Each accent lamp may need to be disconnected to isolate the short to ground. Use the schematic to identify the following:

- All accent lamps equipped with the vehicle
- Component locations on the accent light control circuit
- Each component's control circuit terminals

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the appropriate courtesy lamp. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the appropriate ground circuit terminal below and ground.

- E63D Flood Lamp - Driver Door Handle terminal 2
- E63LR Flood Lamp - Left Rear Door Handle terminal 2
- E63RR Flood Lamp - Right Rear Door Handle terminal 2
- E63P Flood Lamp - Passenger Door Handle terminal 2
- E1D Accent Lamp - Driver Door terminal 1
- E1P Accent Lamp - Passenger Door terminal 1
- E1W Accent Lamp - Instrument Panel terminal 2
- S48B Multifunction Switch - Overhead Console terminal 5
- **If 5 Ω or greater**

1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
 - E63D Flood Lamp - Driver Door Handle terminal 1
 - E63LR Flood Lamp - Left Rear Door Handle terminal 1
 - E63RR Flood Lamp - Right Rear Door Handle terminal 1
 - E63P Flood Lamp - Passenger Door Handle terminal 1
 - E1D Accent Lamp - Driver Door terminal 2
 - E1P Accent Lamp - Passenger Door terminal 2
 - E1W Accent Lamp - Instrument Panel terminal 3
 - S48B Multifunction Switch - Overhead Console terminal 2
4. Verify the test lamp turns ON and OFF when commanding the appropriate Accent Lighting Command ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate accent lamp

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Front Side Door Inside Handle Illumination Lamp Replacement](#)
- Refer to [Rear Side Door Inside Handle Illumination Lamp Replacement](#)
- Refer to [Control Module References](#) for BCM replacement, programming, and setup

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, park lamps ON.
2. Verify the scan tool LED Backlight Dimming Command parameter changes between a high percentage to a low percentage while operating the dimmer switch from high to low.

- **If the parameter does not change**

Refer to Dimmer Switch Malfunction.

- **If the parameter changes**

3. Verify the backlighting components turn ON and OFF while commanding the LED Backlight Dimming ON and OFF with a scan tool.

- **If the backlighting components do not turn ON and OFF**

Refer to Interior Backlighting Malfunction.

- **If the backlighting components turn ON and OFF**

4. Verify the switch indicator amber LED's for the components listed below illuminate when the appropriate switch is commanded ON and OFF.

- S48B Multifunction Switch - Overhead Console
- S48E Multifunction Switch - Center Console
- S32LR Seat Heating Switch - Left Rear
- S32RR Seat Heating Switch - Right Rear

- **If the switch indicator amber LED's do not illuminate**

Refer to Switch Indicator Amber LED Backlighting Malfunction.

- **If the switch indicator amber LED's illuminate**

5. Verify the vehicle on/off switch backlighting switch illuminates during entry backlighting mode.

- **If the switch does not illuminate**

Refer to Vehicle On/Off Switch Malfunction.

- **If the switch illuminates**

6. All OK.

Circuit/System Testing

Dimmer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S30 Headlamp Switch, vehicle in Service Mode.
2. Test for B+ between the B+ circuit terminal 12 and ground.

- **If less than B+**

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If B+**
3. Verify a test lamp illuminates between the B+ circuit terminal 12 and the low reference circuit terminal 7.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the low reference circuit terminal 7 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp illuminates**
 4. Verify a test lamp does not illuminate between the B+ circuit terminal 12 and the signal circuit terminal 11.
 - **If the test lamp illuminates**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
 5. Test for B+ between the B+ circuit terminal 12 and the signal circuit terminal 11.
 - **If less than B+**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 11 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If B+**
 6. Test or replace the S30 Headlamp Switch.

Interior Backlighting Malfunction

NOTE: Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Backlighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.

• **If the test lamp does not illuminate and the circuit fuse is good**

1. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

• **If the test lamp does not illuminate and the circuit fuse is open**

1. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

• **If the test lamp illuminates**

3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.

4. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 min for all vehicle systems to power down.

5. Test for less than 5 Ω between the appropriate ground circuit terminal and ground.

• **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

• **If less than 5 Ω**

6. Connect a test lamp between the appropriate control circuit terminal and ground, vehicle in Service Mode.

7. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.

• **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.

- X2 terminal 8
- X7 terminal 9

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode
 - X2 terminal 8
 - X7 terminal 9
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the component with inoperative backlighting.

Switch Indicator Amber LED Backlighting Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Disconnect the harness connectors at the components listed below.
 - S32LR Seat Heating Switch - Left Rear
 - S32RR Seat Heating Switch - Right Rear
 - S48B Multifunction Switch - Overhead Console
 - S48E Multifunction Switch - Center Console

NOTE: The test lamp in the following step will illuminate at LOW intensity. This is normal circuit operation and does not indicate a circuit malfunction.

5. Vehicle in Service Mode, verify a test lamp illuminates between each control circuit terminal listed below

and ground.

- S32LR Seat Heating Switch - Left Rear terminal 6
- S32RR Seat Heating Switch - Right Rear terminal 6
- S48B Multifunction Switch - Overhead Console terminal 18
- S48E Multifunction Switch - Center Console terminal 3
- **If the test lamp does not illuminate**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp illuminates**

6. Verify a test lamp does not illuminate at FULL intensity between each control circuit terminal listed below and ground.

- S32LR Seat Heating Switch - Left Rear terminal 6
- S32RR Seat Heating Switch - Right Rear terminal 6
- S48B Multifunction Switch - Overhead Console terminal 18
- S48E Multifunction Switch - Center Console terminal 3
- **If the test lamp illuminates at FULL intensity**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp does not illuminate at FULL intensity**

7. Test or replace the component with the inoperative switch indicator.

Vehicle On/Off Switch Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If the test lamp illuminates**

3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 5 Ω between the ground circuit terminal 4 and ground.

- **If 5 Ω or greater**

1. Ignition OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

6. Connect a test lamp between the control circuit terminal 8 and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the appropriate Accent Lighting Command ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

8. Test or replace the S83 Vehicle On/Off Switch

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamps ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, license plate lamps, and side marker lamps control circuits illuminating the park, tail, license, and side marker lamps.

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Park Lamp Switch parameter changes between Active and Inactive while commanding the park lamps ON and OFF with the Headlamp Switch.
 - **If the parameter does not change**

Refer to Park Lamp Switch Malfunction.

- **If the parameter changes**

3. Verify the left front park lamp turns ON and OFF when commanding the Left Front Park Lamp ON and OFF with a scan tool.

- **If the left front park lamp does not turn ON and OFF**

Refer to Park Lamps Malfunction.

- **If the left front park lamp turns ON and OFF**

4. Verify the left rear park lamp turns ON and OFF when commanding the Left Rear Park Lamp ON and OFF with a scan tool.

- **If the left rear park lamp does not turn ON and OFF**

Refer to Park Lamps Malfunction.

- **If the left rear park lamp turns ON and OFF**

5. Verify the right front park lamp turns ON and OFF when commanding the Right Front Park ON and OFF with a scan tool.

- **If the right front park lamp does not turn ON and OFF**

Refer to Park Lamps Malfunction.

- **If the right front park lamp turns ON and OFF**

6. Verify the right rear park lamp turns ON and OFF when commanding the Right Rear Park ON and OFF with a scan tool.

- **If the right rear park lamp does not turn ON and OFF**

Refer to Park Lamps Malfunction.

- **If the right rear park lamp turns ON and OFF**

7. Verify the license plate lamps turn ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.

- **If the license plate lamps do not turn ON and OFF**

Refer to License Plate Lamps Malfunction.

- **If the license plate lamps turn ON and OFF**

8. All OK.

Circuit/System Testing

Park Lamp Switch Malfunction

1. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 8 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

3. Vehicle in Service Mode.
4. Verify the scan tool Park Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 8.
6. Verify the scan tool Park Lamps Switch parameter is Active.
 - **If not Active**
 1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If Active**
7. Test or replace the S30 Headlamp Switch.

Park Lamps Malfunction

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module
 - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module
 - **If the test lamp illuminates**
 4. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
 5. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the inoperative park lamp.
 6. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
 - E4AC Park/Daytime Running Lamp - Left terminal 3
 - E4AD Park/Daytime Running Lamp - Right terminal 3
 - E2LF Side Marker Lamp - Left Front terminal B
 - E2RF Side Marker Lamp - Right Front terminal B
 - E42L Tail Lamp Assembly - Left terminal 6
 - E42R Tail Lamp Assembly - Right terminal 6
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
 7. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
 - E4AC Park/Daytime Running Lamp - Left terminal 2
 - E4AD Park/Daytime Running Lamp - Right terminal 2
 - E2LF Side Marker Lamp - Left Front terminal A
 - E2RF Side Marker Lamp - Right Front terminal A
 - E42L Tail Lamp Assembly - Left terminal 2
 - E42R Tail Lamp Assembly - Right terminal 2
 8. Verify the test lamp turns ON and OFF when commanding the appropriate Park Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

• **If the test lamp is always ON**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

• **If the test lamp turns ON and OFF**

9. Test or replace the appropriate park lamp.

License Plate Lamps Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.

• **If the test lamp does not illuminate and the circuit fuse is good**

1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

• **If the test lamp does not illuminate and the circuit fuse is open**

1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module

• **If the test lamp illuminates**

3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, remove the appropriate E7 License Plate Lamp bulbs.
5. Test for less than 5 Ω between each ground circuit terminal 2 and ground.

• **If 5 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

• **If less than 5 Ω**

6. Connect a test lamp between the appropriate E7 License Plate Lamp control circuit terminal 1 and ground, vehicle in Service Mode.

7. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground at the appropriate E7 License Plate Lamp.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end at the appropriate E7 License Plate Lamp.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal and ground at the appropriate E7 License Plate Lamp.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

8. Test or replace the appropriate E7 License Plate Lamp bulb.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Headlamp Replacement](#)
- Refer to [Headlamp Bulb Replacement \(Left Side\)](#)[Headlamp Bulb Replacement \(Right Side\)](#)
- Refer to [Daytime Running Lamp Replacement](#)
- Refer to [Rear License Plate Lamp Replacement](#)
- Refer to [Stop and Tail Lamp Bulb Replacement](#)
- Refer to [Headlamp Switch Replacement](#)
- Refer to [Control Module References](#) for BCM replacement, programming, and setup

REAR COMPARTMENT LAMP MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to	Open/High	Short to	Signal
---------	----------	-----------	----------	--------

	Ground	Resistance	Voltage	Performance
F18DA (BCM 7) Fuse B+	B3948 01, B3951 01	B3948 01, B3951 01	-	-
Cargo Lamp Control	B2570 02	1	1	-
Cargo Lamp Ground	-	1	-	-
1. Rear Compartment Lamp Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the cargo lamp through the cargo lamp control circuit. When the BCM receives a rear liftgate open input from the rear compartment lid latch, the BCM applies battery voltage to the cargo lamp control circuit illuminating the cargo lamp. In the event that the cargo lamp were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position, the BCM will deactivate the cargo lamp control circuit to prevent total battery discharge.

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module
- **If the test lamp illuminates**
 3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
 4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E33 Cargo Lamp. It may take up to 2 min for all vehicle systems to power down.
 5. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
 6. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
 7. Verify the test lamp turns ON and OFF when commanding the Cargo Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 8. Test or replace the E33 Cargo Lamp.

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Brake Pedal Applied parameter changes between Active and Inactive while pressing and releasing the brake pedal.
 - **If the parameter does not change**

Refer to Brake Pedal Position Sensor Malfunction.
 - **If the parameter changes**
3. Verify the left brake lamp turns ON and OFF when commanding the Left Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the left brake lamp does not turn ON and OFF**

Refer to Stop Lamps Malfunction.
 - **If the left brake lamp turns ON and OFF**
4. Verify the right brake lamp turns ON and OFF when commanding the Right Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the right brake lamp does not turn ON and OFF**

Refer to Stop Lamps Malfunction.

- **If the right brake lamp turns ON and OFF**

5. Verify the center high mounted stop lamp turns ON and OFF when commanding the Center Brake Lamp ON and OFF with a scan tool.

- **If the center high mounted stop does not turn ON and OFF**

Refer to Center High Mount Stop Lamp Malfunction.

- **If the center high mounted stop turns ON and OFF**

6. All OK.

Circuit/System Testing

Brake Pedal Position Sensor Malfunction

1. Vehicle OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, vehicle in Service Mode.

2. Test for B+ between the low reference circuit terminal 2 and B+.

- **If less than B+**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K9 Body Control Module.

- **If B+**

3. Test for less than 1 V between the low reference circuit terminal 2 and ground.

- **If 1 V or greater**

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the low reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K9 Body Control Module.

- **If less than 1 V**

4. Test or replace the B22 Brake Pedal Position Sensor.

Stop Lamps Malfunction

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
4. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
5. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E5 Stop Lamp.
6. Test for less than 5 Ω between the ground circuit terminal B and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
7. Connect a test lamp between the control circuit terminal A and ground, vehicle in Service Mode.
8. Verify the test lamp turns ON and OFF when commanding the appropriate Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X4 - left stop lamp
 - X5 - right stop lamp
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control

Module, vehicle in Service Mode.

- X4 - left stop lamp
- X5 - right stop lamp

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

• **If the test lamp turns ON and OFF**

9. Test or replace the appropriate E5 Stop Lamp.

Center High Mount Stop Lamp Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.

• **If the test lamp does not illuminate and the circuit fuse is good**

1. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

• **If the test lamp does not illuminate and the circuit fuse is open**

1. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

• **If the test lamp illuminates**

3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.

4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E6 Center High Mounted Stop Lamp.

5. Test for less than 5 Ω between the ground circuit terminal 2 and ground.

• **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

• **If less than 5 Ω**

6. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.

7. Verify the test lamp turns ON and OFF when commanding the Center Brake Lamp ON and OFF with a scan tool.

• **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the E6 Center High Mounted Stop Lamp.

Turn Signal/Multifunction Switch Ground	-	2	-	-
1. Turn Signal Lamps and/or Indicators Malfunction 2. Turn Signal/Multifunction Switch Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the vehicle mode switch in the SERVICE MODE or ON positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Diagnostic Aids

The tail lamp outage detection circuits are low current B+ circuits that will not illuminate a test lamp.

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Verify the scan tool Right Turn Signal Switch and Left Turn Signal Switch parameters change between Active and Inactive while cycling the turn signal switch between the right and left positions.
 - **If the parameters do not change**
Refer to Turn Signal/Multifunction Switch Malfunction.
 - **If the parameters change**
3. Verify the left front turn signal lamp turns ON and OFF while commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the left front turn signal lamp does not turn ON and OFF**
Refer to Turn Signal Lamps Malfunction.
 - **If the left front turn signal lamp turns ON and OFF**
4. Verify the right front turn signal lamp turns ON and OFF while commanding the Right Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the right front turn signal lamp does not turn ON and OFF**
Refer to Turn Signal Lamps Malfunction.
 - **If the right front turn signal lamp turns ON and OFF**
5. Verify the left rear turn signal lamp turns ON and OFF while commanding the Left Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the left rear turn signal lamp does not turn ON and OFF**
Refer to Turn Signal Lamps Malfunction.
 - **If the left rear turn signal lamp turns ON and OFF**
6. Verify the right rear turn signal lamp turns ON and OFF while commanding the Right Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the right rear turn signal lamp does not turn ON and OFF**
Refer to Turn Signal Lamps Malfunction.
 - **If the right rear turn signal lamp turns ON and OFF**
7. Verify the left and right turn signal indicators turn ON and OFF while commanding the Instrument Cluster Gauge Sweep Test ON and OFF with a scan tool.

- **If the left or right turn signal indicators do not turn ON and OFF**

Refer to Turn Signal Indicators Malfunction.

- **If the left and right turn signal indicators turn ON and OFF**

8. All OK.

Circuit/System Testing

Turn Signal/Multifunction Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 3 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Left Turn Signal Switch parameter is Inactive.
 - **If not Inactive**
 1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 3.
6. Verify the scan tool Left Turn Signal Switch parameter is Active.
 - **If not Active**
 1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If Active**
7. Verify the scan tool Right Turn Signal Switch parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

8. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
9. Verify the scan tool Right Turn Signal Switch parameter is Active.

- **If not Active**

1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If Active**

10. Test or replace the S78 Turn Signal/Multifunction Switch.

Turn Signal Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E4 Turn Signal Lamp.
2. Test for less than 10 Ω between the ground circuit at the socket terminal and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Connect a test lamp between the control circuit at the socket terminal and ground.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Turn Signal Lamp ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X5 left turn signals
 - X4 right turn signals
2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode.
 - X5 left turn signals
 - X4 right turn signals
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 5. Test or replace the appropriate E4 Turn Signal Lamp.

Turn Signal Indicators Malfunction

1. Vehicle in Service Mode.
2. Verify the left and right turn signal indicators turn ON and OFF while commanding the Instrument Cluster Gauge Sweep Test ON and OFF with a scan tool.
 - **If the left or right turn signal indicators are always OFF or remain ON**

Replace the P16 Instrument Cluster.
 - **If the left and right turn signal indicators turn ON and OFF**
3. Replace the K9 Body Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Front Turn Signal Lamp Bulb Replacement](#)
- Refer to [Turn Signal Bulb Replacement](#)
- Refer to [Stop and Tail Lamp Bulb Replacement](#)
- Refer to [Turn Signal Switch Replacement](#)
- Refer to [Control Module References](#) for BCM or Instrument Cluster replacement, programming and setup

REPAIR INSTRUCTIONS

WIRE TO WIRE REPAIR - LIGHTING

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool (non GMNA)
- **J-38125-5A** Ultra Torch Special Tool
- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to [Special Tools](#).

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

NOTE: If the wiring harness internal to the transmission is damaged, the wiring harness must be replaced. The use of splice sleeves in an attempt to repair the internal transmission wires, connectors, or terminals could result in performance issues.

NOTE: Do not splice wires in Door Harness Grommets.

NOTE: The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides the necessary low resistance contact integrity for these sensitive, low energy circuits.

Use only DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Selection

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm ² /(AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19300089	Red (1) or Red/Green (1)	Red (2)	0.22 - 0.8/(18 - 26)
Blue 19168447	Blue (2)	Blue (3)	1.0 - 2.0/(14 - 16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0 - 5.0/(10 - 12)

NOTE: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:

- Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
- Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
- Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.

2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:

- When adding a length of wire to the existing harness, use the same size wire as the original wire.
- Perform one of the following items in order to find the correct wire size:
 - Find the wire on the schematic and convert to regional wiring gauge size.
 - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
- Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
- Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
- If the wire is damaged, repeat this procedure after removing the damaged section.

4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.

5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

Fig. 10: Splice Sleeve Crimping Tool With 4 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

Fig. 11: Splice Sleeve Crimping Tool With 3 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

Fig. 12: Identifying DuraSeal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

Fig. 13: Crimped DuraSeal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to **Folded-Over Wire Repair** for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

Fig. 14: Heated Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

12. Using the heat torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Weatherpack™ Wiring Repair

NOTE: Some replacement pigtail connectors may be delivered without the terminated leads installed into the connector. For Weatherpack™ connectors, all terminated leads included in the package should to be installed into the connector. If the connector end view shows that a terminal is not occupied, the extra terminated lead(s) need to be installed and the end(s) sealed using a DuraSeal splice sleeve and taped back into the harness.

1. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [Folded-Over Wire Repair](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.

Fig. 15: Tightly Close Handles Of Crimp Tool
Courtesy of GENERAL MOTORS COMPANY

2. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Holding the DuraSeal with one hand gently tug on the wire to ensure it is crimped in the DuraSeal.

3. Using the heat torch, apply heat to the crimped area of the barrel.

Fig. 16: Heat To Crimped Area Of Barrel

Courtesy of GENERAL MOTORS COMPANY

4. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Fig. 17: Taping Extra Terminated Leads Back Into Harness
Courtesy of GENERAL MOTORS COMPANY

5. Tape the extra terminated lead(s) back into the harness.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the heat torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

CONNECTOR RECONNECTION - LIGHTING

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#).

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Loose, corroded, or painted terminal stud/fastener
- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- A terminal not seated all the way into the connector body
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease/lubricant (Nyogel

760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center. Use the **EL-35616** kit to test for proper terminal contact. Failure to use the **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter into the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Power Distribution Schematics](#) .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point (screw or stud). Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underhood/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.
 - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition

components, motors, generator etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.

- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#) .
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

BRAKE PEDAL POSITION SENSOR CALIBRATION

Calibration Criteria

NOTE: **Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.**

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM), engine control module (ECM), or hybrid powertrain control module have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM/HPCM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Vehicle in Service Mode, place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual transmission.

- 3. Install a scan tool.
- 4. Clear all DTCs before proceeding.
- 5. Navigate to the Configuration/Reset Functions menu of the BCM.
- 6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

BRAKE PEDAL POSITION SENSOR REPLACEMENT

Fig. 18: Brake Pedal Position Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Floor Front Air Outlet Duct - Left Side. Refer to Floor Front Air Outlet Duct Replacement - Left Side	
1	Brake Pedal Position Sensor Bolt CAUTION: Refer to Fastener Caution . Tighten 3 N.m (27 lb in)
2	Brake Pedal Position Sensor Washer

Callout	Component Name
3	Brake Pedal Position Sensor Procedure 1. Disconnect the electrical connector. 2. After the installation is complete, calibrate the brake pedal position sensor. Refer to Brake Pedal Position Sensor Calibration

HEADLAMP SWITCH REPLACEMENT

Fig. 19: Headlamp Switch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Instrument Panel Switch Trim Plate. Refer to Instrument Panel Switch Trim Plate Replacement	
1	Headlamp Switch Procedure 1. Disconnect the electrical connector. 2. Depress tabs on switch and remove from the instrument switch trim plate.

INTERIOR LAMP AND MULTIFUNCTION SWITCH REPLACEMENT

Fig. 20: Interior Lamp And Multifunction Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Instrument Panel Switch Trim Plate. Refer to Instrument Panel Switch Trim Plate Replacement	
1	Interior Lamp and Multifunction Switch Procedure 1. Disconnect the electrical connector. 2. Depress tabs on switch and remove from the instrument switch trim plate.

HAZARD WARNING SWITCH REPLACEMENT

Fig. 21: Hazard Warning Switch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure It is only necessary to lift up the front floor console accessory trim plate. Only do those steps in the front floor console accessory trim plate replacement that will lift up the front floor console accessory trim plate enough to gain access to the part. Refer to Front Floor Console Accessory Trim Plate Replacement	
1	Hazard Warning Switch Procedure Release the tabs and remove the switch.

CENTER READING LAMP REPLACEMENT

Fig. 22: Center Reading Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Center Reading Lamp Procedure 1. Depress the rear integral tabs using the appropriate tool to remove the reading lamp from the headlining trim panel. 2. Disconnect the electrical connector.

FRONT FLOOR CONSOLE BIN LAMP REPLACEMENT

Fig. 23: Front Floor Console Bin Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Floor Console Bin lamp Procedure 1. Release the plastic retaining tabs. 2. Disconnect the electrical connector.

FRONT SIDE DOOR INSIDE HANDLE ILLUMINATION LAMP REPLACEMENT

Fig. 24: Front Side Door Inside Handle Illumination Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Front Side Door Trim. Refer to Front Side Door Trim Replacement	
1	Front Side Door Inside Handle Illumination Lamp Procedure 1. Disconnect the electrical connector. 2. Unsnap lamp from the trim panel tabs.

REAR SIDE DOOR INSIDE HANDLE ILLUMINATION LAMP REPLACEMENT

Fig. 25: Rear Side Door Inside Handle Illumination Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear Side Door Trim. Refer to Rear Side Door Trim Replacement	
1	Rear Side Door Inside Handle Illumination Lamp Procedure 1. Disconnect the electrical connector. 2. Unsnap lamp from the trim panel tabs.

SUNSHADE ILLUMINATED MIRROR LAMP BULB REPLACEMENT

Fig. 26: Sunshade Illuminated Mirror Lamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Sunshade Illuminated Mirror Lamp Lens (Qty: 2) Procedure Carefully use a flat bladed tool and release the tabs retaining the lamp lens to the sunshade.
2	Sunshade Illuminated Mirror Lamp Bulb (Qty: 2)

HEADLAMP REPLACEMENT

Fig. 27: Headlamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The High Voltage Disabling procedure includes the following steps: • Identify how to disable high voltage. • Identify how to	

Callout	Component Name
	test for the presence of high voltage. - Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed. Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: - Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors. - Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors. - Visually and functionally inspect the gloves before use. - Wear the Insulation gloves with

Callout	Component Name
	leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not. Failure to follow the procedures may result in serious injury or death. Preliminary Procedures 1. Open the hood. 2. Remove Front Bumper Fascia. Refer to Front Bumper Fascia Removal and Installation 3. Disconnect all electrical connectors.
1	Headlamp Bolt (Qty: 4) CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m (22 lb in)
2	Headlamp WARNING: Refer to Halogen Bulb Warning . Procedure

Callout	Component Name
	1. Transfer components as necessary. 2. Adjust headlamp. Refer to Headlamp Aiming

HEADLAMP BULB REPLACEMENT (LEFT SIDE)

Fig. 28: Headlamp Bulb (Left Side)
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to Halogen Bulb Warning .	
Preliminary Procedures 1. Open the hood. 2. Unclip and reposition the engine wiring harness and retainers as necessary to gain access to the part.	
1	Headlamp Bulb Access Cover Procedure Rotate the access cover a quarter turn counterclockwise and remove.

Callout	Component Name
2	Headlamp Bulb Procedure 1. Disconnect the electrical connector. 2. Rotate the bulb a quarter turn counterclockwise and remove.

HEADLAMP BULB REPLACEMENT (RIGHT SIDE)

Fig. 29: Headlamp Bulb (Right Side)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to Halogen Bulb Warning . Preliminary Procedures 1. Open the hood. 2. Remove Windshield Washer Solvent Container Filler Tube. Refer to Windshield Washer Solvent Container Filler Tube Replacement	

HEADLAMP AIMING

Visual Aiming Preparation Procedure

NOTE: Some state and local laws specify requirements for headlamp aim. Comply with all of these laws when performing any headlamp aiming operations.

Headlamp aim should be checked:

- When a new headlamp capsule is installed.
- If service or repairs to the front end area have, or may have, disturbed the headlamps or their mounting.

The aiming screen should meet the following criteria:

- The area will consist of a level surface large enough to allow for a vehicle and an additional 7.62 m (25 ft) measured from face of lamps to the front of the aiming screen.
- The screen will be 1.52 m (5 ft) high x 3.66 m (12 ft) wide with a matte white surface well shaded from extraneous light, and properly adjusted to the floor on which the vehicle stands. Provisions should be made to align the aiming screen parallel with the vehicle.
- The screen shall be provided with a fixed vertical centerline, two laterally adjustable vertical tapes, and one vertically adjustable horizontal tape.
- If a regular commercial aiming screen is not available, the screen may consist of a vertical wall having a clear uninterrupted area approximately 1.83 m (6 ft) high and 3.66 m (12 ft) wide. The surface should be finished with a washable non-gloss white paint.

Fig. 30: Headlamp Aiming Screen Layout

Courtesy of GENERAL MOTORS COMPANY

- After the aiming screen has been set up in a permanent location, paint a reference line on the floor directly under the lens of the lamps to indicate the proper location of the headlamps when they are being aimed:
 - Distance between headlamps (1)
 - Center line of screen (2)
 - Adjustable vertical pointer (3)
 - Adjustable horizontal tape (4)
 - Diagram of light screen (5)
 - Vertical center line ahead of right headlamp pointer position (6)
 - 7.62 m (25 ft) (7)
 - Car axis (8)
 - Adjustable vertical pointer
 - Horizontal center line of lamps
 - Vertical center line ahead of left headlamp

Prior to aiming the headlamps, the following steps must be taken:

1. Engage the PARK brake.
2. Remove any snow, ice or mud from the vehicle.
3. The vehicle must have a full tank of gas.
4. Stop all other work on the vehicle.
5. If any service has been performed on the vehicle, make sure that all of the components are back in their original place.
6. The vehicle must be on a level surface.

Fig. 31: Headlamp Aiming Alignment

Courtesy of GENERAL MOTORS COMPANY

7. The vehicle left tires must be aligned with the reference line extending from the screen with the headlamps aligned with the reference line.
8. Do not load any cargo in the vehicle.
9. The vehicle must contain approximately 75 kg (165 lb) on the driver seat.
10. Inflate the tires to the proper pressure.

11. Simulate the vehicle loads if the intended use of the vehicle is for hauling heavy loads or towing a trailer.
12. Rock the vehicle in order to stabilize the suspension.
13. Turn on the headlamps to low beam and observe the left and the top edges of the high intensity zone on the screen. The edges of the high intensity zone should fall within the specifications.

Headlamp Aiming Procedure

1. Open the hood.

Fig. 32: Headlamp Bulb Aiming Distance

Courtesy of GENERAL MOTORS COMPANY

2. Measure from the floor to the center of the headlamp bulb. Some headlamps have an aim dot marked on the headlamp lens.
3. At the screen, measure from the floor and place the horizontal tape at the measured distance.
4. Measure from the reference line on the floor to the left headlamp bulb centerline.
5. At the screen, measure from the reference line and place the vertical tape at the measured distance.
6. Measure from the reference line on the floor to the right headlamp bulb centerline.
7. At the screen, measure from the reference line and place the vertical tape at the measured distance.

Fig. 33: Headlamp Projection On Screen

Courtesy of GENERAL MOTORS COMPANY

NOTE: **DO NOT cover the headlamp. This may cause excessive heat build up.**

8. Turn ON the low beam headlamps. Block the light from projecting onto the screen from the passenger side headlamp.

Fig. 34: Headlamp Adjustment Components
Courtesy of GENERAL MOTORS COMPANY

NOTE: The headlamps can not be adjusted horizontally.

9. Adjust the vertical aim screw of the headlamps to the specifications required by the state and the local authorities, or as shown in step number 8.
10. Repeat the aiming procedure for the passenger side headlamp while blocking the light from projecting onto the screen from the driver side headlamp.
11. Turn the headlamps OFF.
12. Close the hood.

DAYTIME RUNNING LAMP REPLACEMENT

Fig. 35: Daytime Running Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to Halogen Bulb Warning . WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The High Voltage Disabling procedure includes the following	

Callout	Component Name
steps: • Identify how to disable high voltage. • Identify how to test for the presence of high voltage. • Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed. Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: • Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors. • Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors. • Visually and functionally	

Callout	Component Name
	inspect the gloves before use. • Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not. Failure to follow the procedures may result in serious injury or death. Preliminary Procedures 1. Remove Front Bumper Fascia. Refer to Front Bumper Fascia Removal and Installation 2. Disconnect the electrical connector.
1	Daytime Running Lamp Screw (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m (22 lb in)
2	Daytime Running Lamp

FRONT TURN SIGNAL LAMP BULB REPLACEMENT

Fig. 36: Front Turn Signal Lamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Headlamp. Refer to Headlamp Replacement	
1	Front Turn Signal Lamp Bulb Access Cover Procedure 1. Rotate the cover a quarter turn counter-clockwise and remove the headlamp. 2. Disconnect the electrical connector. NOTE: The access cover and the lamp socket are a one piece assembly and removed together as an assembly.
2	Front Turn Signal Lamp Bulb Procedure Pull the bulb straight from the lamp socket.

TURN SIGNAL BULB REPLACEMENT

Fig. 37: Turn Signal Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Body Structure Stop Lamp. Refer to Rear Body Structure Stop Lamp Replacement	
1	Turn Signal Bulb Socket Procedure Rotate the bulb socket a quarter turn counterclockwise and remove.
2	Turn Signal Bulb Procedure Pull the bulb from the bulb socket.

HIGH MOUNT STOP LAMP REPLACEMENT

Fig. 38: High Mount Stop Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the liftgate. 2. Remove Liftgate Lower Trim Finish Panel. Refer to Liftgate Lower Trim Finish Panel Replacement 3. Disconnect the electrical connector.	
1	High Mount Stop Lamp Nut (Qty: 7) CAUTION: Refer to Fastener Caution . Tighten 4.7 N.m (42 lb in)
2	High Mount Stop Lamp Retainer (Qty: 6) Procedure Depress the retainers from the liftgate while pulling outward on the lamp.
3	High Mount Stop Lamp

REAR BODY STRUCTURE STOP LAMP REPLACEMENT

Fig. 39: Rear Body Structure Stop Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Open the liftgate.	
1	Liftgate Bumper Pad Screw CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 2.5 N.m (22 lb in)
2	Rear Body Structure Stop Lamp Screw (Qty: 2) Tighten 2.5 N.m (22 lb in)
3	Rear Body Structure Stop Lamp Procedure 1. Grasp the stop lamp and give a quick pull rearward in order to disengage the 2 outer

Callout	Component Name
	stop lamp locator pins and retainer from the stop lamp pocket. 2. Disconnect the electrical connector. 3. Transfer components as necessary.

CARGO CENTER COURTESY LAMP BULB REPLACEMENT

Fig. 40: Cargo Center Courtesy Lamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Liftgate Courtesy Lamp. Refer to Liftgate Courtesy Lamp Replacement	
1	Cargo Center Courtesy Lamp Bulb Procedure Pull the bulb from the bulb socket.

BACKUP LAMP BULB REPLACEMENT

Fig. 41: Backup Lamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear Body Structure Stop Lamp. Refer to Rear Body Structure Stop Lamp Replacement	
1	Backup Lamp Bulb Socket Procedure Rotate the bulb socket a quarter turn counterclockwise and remove.
2	Backup Lamp Bulb Procedure Pull the bulb from the bulb socket.

REAR LICENSE PLATE LAMP REPLACEMENT

Fig. 42: Rear License Plate Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear License Plate Lamp Procedure 1. Using a flat-bladed tool, insert the tool on the passenger side of the lamp and push inward and rotate downward to disengage the lamp from the rear bumper fascia opening. 2. Rotate the bulb socket a quarter turn counterclockwise and remove.

REAR LICENSE PLATE LAMP BULB REPLACEMENT

Fig. 43: Rear License Plate Lamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear License Plate Lamp. Refer to <u>Rear License Plate Lamp Replacement</u>	
1	License Plate Lamp Bulb Procedure Pull the bulb straight from the lamp socket.

STOP AND TAIL LAMP BULB REPLACEMENT

Fig. 44: Stop And Tail Lamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Rear Body Structure Stop Lamp. Refer to Rear Body Structure Stop Lamp Replacement	
1	Stop and Tail Lamp Bulb Socket Procedure Rotate the bulb socket a quarter turn counterclockwise and remove.
2	Stop and Tail Lamp Bulb Procedure Pull the bulb from the bulb socket.

REAR FASCIA LOWER SIGNAL LAMP REPLACEMENT

Fig. 45: Rear Fascia Lower Signal Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Bumper Fascia. Refer to Rear Bumper Fascia Removal and Installation	
1	Rear Reflector Retainer Procedure Depress the retainer tabs and pull out from the fascia.
2	Rear Fascia Lower Signal Lamp

LIFTGATE COURTESY LAMP REPLACEMENT

Fig. 46: Liftgate Courtesy Lamp

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Liftgate Courtesy Lamp Procedure 1. Open the liftgate. 2. Using the appropriate trim tool, release the lamp from the rear quarter trim panel. 3. Disconnect the electrical connector.

DESCRIPTION AND OPERATION

EXTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Exterior Lamps

The exterior lighting system consist of the following lamps if equipped:

- Automatic high beam assist
- Backup lamps
- Daytime running lamps
- Hazard warning lamps
- Headlamps

- Park, tail, license, and side marker lamps
- Stop lamps
- Turn signal lamps

Low Beam Headlamps

The headlamps may be turned ON in 3 different ways:

- When the headlamp switch is placed in the ON position, for normal operation
- When the headlamp switch is placed in the AUTO position, for automatic lamp control
- When the headlamp switch is placed in the AUTO position, with the windshield wipers ON in daylight conditions, after a 6 second delay

The BCM will also command the low beam headlamps ON during daylight conditions when the following conditions are met:

- Headlamp switch in the AUTO position
- Windshield wipers ON
- Vehicle in any gear but PARK

The body control module (BCM) monitors three signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, all three signal circuits are open. When placed in the AUTO position, the BCM monitors inputs from the ambient light sensor to determine if headlamps are required or if daytime running lamps will be activated based on outside lighting conditions. When the headlamp switch is placed in the OFF position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is placed in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds to the inputs by illuminating the park lamps and headlamps. When the low beam headlamps are requested, the BCM applies B+ to both low beam headlamp control circuits illuminating the low beam headlamps.

When the BCM commands the low beam headlamps ON, the operator will notice the interior backlighting for the instrument cluster and the various other switches dim to the level of brightness selected by the instrument panel dimmer switch.

High Beam Headlamps

When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the left and right high beam fuses to the high beam control circuits and on to the left and right high beam headlamps illuminating the high beam headlamps.

Automatic High Beam Assist

The automatic high beam assist system operates the high beam headlamps ON and OFF automatically when the system is activated and certain conditions are met. The automatic high beam assist system consists of a front

camera module that detects light and is able to identify approaching vehicles on an even, straight road at a distance of greater than 0.4 km (0.25 mi). The front camera module analyzes light color, intensity, and movement. The automatic high beam assist system will turn OFF the high beam headlamps when approaching vehicle headlamps or preceding vehicle taillights are detected by the front camera module. Automatic high beam assist can be deactivated when the headlamp dimmer switch is moved from the neutral position to the high beam or flash to pass positions. Automatic high beam assist can be reactivated by operating the high beam select switch from the neutral position to the high beam position twice within 2 s.

Automatic High Beam Assist System Activation

- Vehicle ON
- Turn signal/multifunction switch placed in the AUTO position
- Turn signal/multifunction switch high beam dimmer switch must be in the neutral position
- Press the Auto High Beam ON/OFF switch located on the turn signal/multifunction switch
- Outside lighting conditions must be dark
- Vehicle speed greater than 25 MPH (40 km/h)

Automatic High Beam Assist System Operation

The following are conditions that the automatic high beam assist system will turn the high beam headlamps off during operation:

- The system detects approaching traffic headlamps
- The system detects preceding traffic tail lamps
- Ambient light level too high due to towns or twilight situations
- The vehicle's speed drops below 13 MPH (22 km/h)
- Delay

NOTE: **Automatic high beam assist may not operate properly if any of the following conditions exist:**

- Approaching and preceding vehicles lamps are undetectable due to dirt, snow, road spray, smoke, fog, or any other airborne conditions.
- The front camera module is covered with ice, dirt, snow, haze, or is obstructed.
- The vehicle is being driven on winding or hilly road conditions which would make any on coming vehicle headlamps undetectable by the automatic high beam assist system.

Automatic High Beam Assist System Deactivation

- Manually operating the turn signal/multifunction switch high beam dimmer switch from neutral to high beam position
- Press the Auto High Beam ON/OFF switch located on the turn signal/multifunction switch

Automatic High Beam Assist System Indicator

The status of the automatic high beam assist system is shown by a green indicator located on the instrument

panel cluster. When automatic high beam assist is active, the indicator will be illuminated continuously. If the operator deactivates the automatic high beam assist system, the indicator will turn off.

Daytime Running Lamps

The daytime running lamps will illuminate continuously when the following conditions are met:

- The vehicle mode switch is in the RUN or CRANK position
- The shift lever is out of the PARK position for vehicles equipped with automatic transmissions or the parking brake is released for vehicles with manual transmissions
- The low and high beam headlamps are OFF

The ambient light sensor is used to monitor outside lighting conditions. The BCM monitors the ambient light sensor via serial data to determine if outside lighting conditions are correct for either daytime running lights or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions the BCM will command the designated daytime running lights ON. During low light conditions the BCM will command the low beam headlamps ON. Any function or condition that turns on the headlamps will cancel daytime running lights operation.

Flash to Pass

When the low beam headlamps are on and the turn signal/multi-function switch is momentarily placed in the flash to pass position, ground is applied to the turn signal/multi-function switch. The turn signal/multifunction switch applies ground to the BCM through the flash to pass switch signal circuit. The BCM then applies ground to the high beam relay control circuit. This energizes the high beam relay, closing the switch side contacts of the high beam relay, applying battery voltage to the left and right high beam fuses. Battery voltage is applied from the high beam fuses through the high beam voltage supply circuit to the high beam headlamp assemblies. This causes the high beam headlamps to illuminate at full brightness momentarily or until the flash to pass switch is released.

Hazard Lamps

The hazard flashers may be activated in any power mode. The hazard switch signal circuit is momentarily grounded when the hazard switch is pressed. The body control module (BCM) responds to the hazard switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard switch is activated, the BCM sends a serial data message to the instrument panel cluster requesting both turn signal indicators to be cycled ON and OFF.

The instrument panel dimmer switch controls the brightness of the interior backlighting components. When the instrument panel dimmer switch is placed in a desired brightness position, the body control module (BCM) receives a signal from the instrument panel dimmer switch and responds by applying a pulse width modulated (PWM) voltage to the hazard switch light emitting diode (LED) backlighting control circuit illuminating the LED to the desired level of brightness.

Park, Tail, License, and Side Marker Lamps

The park lamps, tail lamps, license plate lamps, and side marker lamps are turned ON when the headlamp switch is placed in the PARK LIGHT or LOW BEAM position or anytime the headlights are requested. When the BCM receives a request from the headlamp switch to turn ON the park lamps the BCM sends out a PWM signal, which illuminates the park lamps, tail lamps, license plate lamps, and side marker lamps.

Stop Lamps

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp control circuit illuminating the left and right stop lamps and the center high mounted stop lamp. Regen on Demand allows increased deceleration by pressing and holding the steering wheel paddle. It works in D (Drive) and L (Low). The accelerator pedal must be fully released for it to work, cruise control will turn off, and the brake lights may come on, when this feature is activated.

Turn Signal Lamps

Ground is applied at all times to the turn signal/multi-function switch. The turn signal lamps may only be activated with the vehicle ON/OFF switch in the Service Mode or ON position. When the turn signal/multi-function switch is placed in either the TURN RIGHT or TURN LEFT position, ground is applied to the BCM through either the right turn or left turn signal switch signal circuit. The BCM then applies a pulsating voltage to the front and rear turn signal lamps through their respective voltage supply circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Backup Lamps

With the engine ON and the transmission in the REVERSE position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the REVERSE position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the REVERSE position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The vehicle must be ON for the backup lamps to operate.

Battery Run Down Protection/Inadvertent Power

To provide battery run down protection, the exterior lamps will be deactivated automatically under certain conditions. The BCM monitors the state of the headlamp switch. If the park or headlamp switch is ON when the vehicle mode switch is placed in either the CRANK or RUN position and then placed in the OFF position, the BCM initiates a 10 min timer. At the end of the 10 min, the BCM will turn off the control power output to the park lamp controls as well as the headlamp relay coils, deactivating the exterior lamps. This feature will be cancelled if any power mode other than OFF becomes active. The BCM will disable battery run down protection if any of the following conditions exist. The park or headlamp switch is placed in the ON to OFF position, and back to the ON position during battery run down protection. The BCM determined that the park or headlamp switch was not active when the vehicle mode switch was turned OFF.

INTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Interior Lamps

The interior lamps consist of 2 groups, those which can dim from the instrument panel cluster lamps dimmer switch and those that can not dim.

Courtesy/Illuminated Entry Lamps

The following lamps may be manually turned ON by placing the interior lamp switch in the ON position, or by opening a door while the switch is in the AUTOMATIC LIGHT position.

- The dome lamp
- The liftgate lamps
- Courtesy lamps

The courtesy lamp supply voltage circuit of the body control module (BCM) supplies battery positive voltage to the dome lamp, the liftgate lamps and courtesy lamps. When any door is opened, the door jamb switch contacts close providing a door open input to the BCM. The BCM then provides a B+ to the interior lamps with the switch in the AUTO position. The interior lamps receive a ground when the switch is in the ON position.

NOTE: If the liftgate is opened after all the modules go to sleep, the dome light will not come on. The liftgate ajar switch input to the BCM will not wake up the BCM once it has gone to sleep, so the dome light will not come on. Once the BCM gets an input to wake it up, from remote keyless entry or a door handle, the dome light will turn on when the liftgate is opened.

If the driver inadvertently leaves any interior lamp ON, the BCM will turn it OFF after a 20 min time-out.

The courtesy lamps will turn OFF immediately if the vehicle ON/OFF switch is turned to the ON position or approximately 20 s after all doors are closed.

Keyless Entry Interior Illumination

When the BCM receives a door unlock command from the remote keyless entry transmitter, the BCM will flash the park lamps several times, illuminate the courtesy and park lamps, and illuminate the low beam headlamps at low intensity. The lamps will remain on until the vehicle ON/OFF switch is turned from the OFF position, a keyless entry transmitter door lock command is received, or after an approximate 20 s delay.

Interior Lamps Dimming

This group includes lamps which may dim. This group may use a combination of vacuum fluorescent illumination, LEDs and incandescent lamps.

- HVAC control module, head assembly
- Rear HVAC control module, head assembly
- Radio
- Rear seat audio
- The instrument panel cluster
- The PRNDL lamp, with the exception of the current gear select position
- Power window switches
- Various switches

When the vehicle ON/OFF switch is turned to the ON position, the vacuum fluorescent display, radio, turns ON at maximum brightness. When the park lamps are ON, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel dimmer switch. At the same time all fluorescent display displays dim to match the indicated dimming level. When the headlamp switch is placed in the PARK position, the park lamp

supply voltage circuit provides an input to the BCM. The BCM then supplies voltage to the instrument panel dimmer switch through the dimming control circuit. The setting of the instrument panel dimmer switch determines the amount of voltage that the instrument panel dimmer switch supplies to the BCM through the instrument panel dimming lamps low reference circuit. The BCM then sends a PWM voltage to all the interior lamps. All the fluorescent display and incandescent back lighting lamps are provided a specific voltage and are then grounded. When the headlight switch is turned to the park lamp or headlamp position, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel dimmer switch. When the instrument panel dimmer switch is moved from MIN to MAX, all fluorescent display displays, as well as all incandescent back lighting respond from minimum intensity to maximum brightness in response to the instrument panel dimmer switch.

Inadvertent Power

The BCM used in this vehicle controls the lighting system through circuits that enable the interior lamps. The BCM opens these enabling circuits shortly after the vehicle ON/OFF switch is turned OFF with no lamp switch activity. If the vehicle ON/OFF switch is turned to any position other than OFF, or if a lamp switch is activated during this period, the timer will reset itself.

Engine Mechanical - 1.5L (L3A)	Approximate Fluid Capacities
Automatic Transmission Fluid Capacities - 5ET50 (MKV)	Approximate Fluid Capacities

FLUID AND LUBRICANT RECOMMENDATIONS

Usage	Fluid/Lubricant
Engine Oil	Use only engine oil licensed to the dexos1 specification, or equivalent, of the proper SAE viscosity grade. ACDelco dexos1 Synthetic Blend is recommended. Use SAE 5W-20 viscosity grade engine oil. Cold Temperature Operation: In an area of extreme cold, where the temperature falls below -29 Â°C (-20 Â°F), an SAE 0W-30 oil may be used. An oil of this viscosity grade will provide easier cold starting for the engine at extremely low temperatures. When selecting an oil of the appropriate viscosity grade, always select an oil of the correct specification. Refer to Owner's Manual for more information.
Engine Coolant	DEX-COOLÂ® (Premix 50/50 with deionized water)
High Voltage Battery Cooling System	Premix DEX-COOL
Power Electronics Cooling System	Premix DEX-COOL
Hydraulic Brake System	DOT 3 Hydraulic Brake Fluid
Windshield Washer	Automotive windshield washer fluid that meets regional freeze protection requirements.
Electric Drive Unit	DEXRONÂ®-VI Automatic Transmission Fluid
Key Lock Cylinders	Multi-Purpose Lubricant, Superlube
Hood, Hatch, and Rear Folding Seat Hinges	Multi-Purpose Lubricant, Superlube
Weatherstrip Conditioning	Weatherstrip Lubricant or Dielectric Silicone Grease

MAINTENANCE SCHEDULE

The Maintenance Schedule information will only be found in the Owner's Manual.

Refer to the Maintenance Schedule subsection of the Owner's Manual, or you may be able to use the Search information function using the words Scheduled Maintenance.

GM OIL LIFE SYSTEM RESETTNG

This vehicle has a computer system that indicates when to change the engine oil and filter. This is based on a combination of factors which includes engine revolutions and engine temperature, and miles driven. Based on driving conditions, the mileage at which an oil change is indicated can vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed.

When the system has calculated that oil life has been diminished, it indicates that an oil change is necessary. A CHANGE ENGINE OIL SOON message comes on. Change the oil as soon as possible within the next 1 000 km (600 miles). It is possible that, if driving under the best conditions, the oil life system might indicate that an oil change is not necessary for up to two years. The engine oil and filter must be changed at least once every two years and, at this time, the system must be reset. Your dealer has trained service people who will perform this work using genuine parts and reset the system. It is also important to check the oil regularly over the course of an oil drain interval and keep it at the proper level.

If the system is ever reset accidentally, the oil must be changed at 5 000 km (3, 000 miles) since the last oil change. Remember to reset the oil life system whenever the oil is changed.

How to Reset the Engine Oil Life System

Reset the system whenever the engine oil change is changed so that the system can calculate the next engine oil change. To reset the system:

1. Use the SELECT knob to select OIL LIFE on the DIC menu.
2. Press SELECT to start the OIL LIFE reset procedure.
3. The DIC menu will display "Are you sure that you want to reset?" Use SELECT to choose YES to reset oil life or NO to exit and return to the previous menu.
4. If YES is selected, the DIC menu will display RESET OIL LIFE for a short time and then 100% OIL LIFE will be display when OIL LIFE is successfully reset.

If the Change Engine Oil Soon message comes back on when the vehicle is started, the engine oil life system has not reset. Repeat the procedure.

GM OIL LIFE SYSTEM RESETTING (WITH SCAN TOOL)

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A ENGINE OIL light message will come on. Change the engine oil as soon as possible within the next 600 miles (1 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

(If applicable)With Scan Tool

1. Ignition - On / Vehicle - In Service Mode
 2. Select:Module Diagnostics
 3. Select:K20 Engine Control Module
 4. Select:Configuration/Reset Functions
 5. Select:Reset Functions
 6. Select:Engine Oil Life Reset
 7. Enter the desired value
 8. Select:Continue

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 01

1. The CHANGE OIL (or CHANGE ENGINE OIL) message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change.
2. To reset the oil life monitor, turn the ignition switch to RUN position, with engine off. Press the TRIP/OIL RESET button on the instrument panel for 12 seconds. The OIL CHANGE light will start to flash to confirm that system is reset (on some models a chime will also sound). Reset is complete when OIL CHANGE light goes out.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 02

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil. To reset CHANGE OIL light:

1. Remove IP fuse block cover (cover can be seen when driver's door is open).
2. Turn ignition ON, engine OFF.
3. Press OIL RESET button and hold for 5 seconds.
4. If Oil Life light does not reset, repeat procedure with ignition OFF.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 03

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil.

1. To reset oil life monitor and turn off CHANGE OIL light (or message), turn ignition to ON position with engine off.
2. Depress accelerator pedal to wide open throttle 3 times within 5 seconds.
3. Turn ignition to LOCK/OFF
4. If light (or message) does not turn off, turn ignition OFF and repeat procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 04

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1, 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

Reset Procedure

1. Turn the ignition key to RUN with the engine OFF.
2. Press the INFO and RESET buttons on the Driver Information Center (DIC) at the same time to enter the personalization menu.
3. Press the INFO button to scroll through the available personalization menu modes until the DIC display shows OIL-LIFE RESET.
4. Press the INFO and RESET buttons at the same time for one second and release.
5. Press and hold the reset button until the DIC display shows ACKNOWLEDGED. This will tell you the system has been reset.
6. Turn the key to LOCK/OFF.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 05

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the oil is nearly worn out. A CHANGE OIL light on left side of instrument cluster is illuminated when it is time to change oil. To reset oil life monitor:

1. Turn ignition on.
2. Depress ENG MET button on trip monitor and release.
3. Within 5 seconds, depress and release ENG MET button again.
4. Within 5 seconds, depress and hold the ENG MET or GAUGES button again. The CHANGE OIL light should flash.
5. Depress and hold the RANGE or GAUGES button until the CHANGE OIL light stops flashing and goes out. When the light goes out, the engine oil life monitor is reset. This should take about 10 seconds.

NOTE: If the light does not reset, turn ignition off and repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 06

The Driver Information Center (DIC) will display a CHANGE OIL message when an oil change is due. The instrument cluster may also have a CHANGE OIL light. To reset the oil life monitor:

Reset Procedure

1. Turn ignition switch to RUN position, with engine off.
2. Press the TRIP (on some models SELECT or SET/RESET) button, located on the DIC, until the OIL LIFE display appears. Message will display percentage of oil life remaining.

NOTE: On models without DIC buttons, use the TRIP/ODOMETER reset stem.

3. Press and hold SET/RESET button (on some models, the check-symbol button) on DIC for at least 5 seconds. The message will change to indicate that the Oil Life has been reset. On some models, 3 chimes will also sound.
4. Turn ignition off.
5. Turn the key to OFF. If the light or message comes back on when you start your vehicle, the oil life system has not reset. Repeat the procedure.

NOTE: On some models, if oil life system does not reset, try turning ignition OFF after displaying oil life message. Then press and hold reset button.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 07

When the system has calculated that oil life has been diminished, it indicates that an oil change is necessary. A CHANGE ENGINE OIL SOON message in the DIC comes on. Reset the system whenever the engine oil is changed so that the system can calculate the next engine oil change. To reset the system:

1. Press the up or down arrow to scroll the DIC to show OIL LIFE.
2. Once the XXX% ENGINE OIL LIFE menu item is highlighted, press and hold the RESET button until the percentage shows 100%

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 08

The CHANGE ENGINE OIL message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change. The oil change interval is not based on mileage, but on engine revolutions and engine operating temperature.

1. There are 2 ways to reset the engine oil life monitor. To reset the engine oil life monitor using the accelerator pedal, go to step 4. To reset the engine oil life monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine off. Press and hold the DISP (on some models, TUNE DISP) button (or knob) on the radio for at least 5 seconds until SETTINGS is displayed.
2. Press the SEEK (on some models, SEEK PTYPE or SEEK PSCAN) up or down arrow to scroll through the main menu. Scroll until OIL LIFE appears on the display. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the DISP/TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message indicator has been reset, scroll through the menu until EXIT appears on the display. Press the DISP/TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. To reset the engine oil life monitor using the accelerator pedal, turn ignition on with engine off. Fully depress and release the accelerator pedal slowly 3 times within 5 seconds. If CHANGE ENGINE OIL light flashes, oil life monitor is reset. If the CHANGE ENGINE OIL light comes back on and stays on, oil life monitor has not reset. Repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 09

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. Press and hold the TRIP button on the steering wheel while turning on the ignition. Do not start the engine.
2. The instrument panel cluster will prompt to clear the service code.
3. Release the button.
4. Press and hold ENTER Switch on the left side of the steering wheel for approximately one second.
5. Turn off the ignition.

If the CHANGE ENGINE OIL SOON message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 10

1. Turn ignition ON, with engine off.
2. Press and release reset stem on instrument panel while OIL LIFE message is displayed.
3. Once the alternating OIL LIFE and RESET messages appear, press and hold stem in until several beeps will sound. This confirms that oil life system has been reset. Turn ignition off or full LOCK position. If CHANGE OIL messages comes back after starting engine, repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 11

Reset Procedure

If vehicle is equipped with a Driver Information Center (DIC), reset oil life monitor by pressing the Driver Information Center SELECT button for 5 seconds while ENGINE OIL LIFE is displayed.

Alternate Method

To reset the oil life monitor, turn ignition switch to ON or RUN position with engine off. Depress accelerator pedal slowly to wide open throttle 3 times within 5 seconds. If CHANGE ENG OIL light flashes for 5 seconds, oil life monitor is reset. If the CHANGE ENG OIL light does not flash, oil life monitor has not reset. Repeat this step.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 12

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, turn ignition on. Open glove box to access oil reset button. Press and hold oil reset button in glove box for at least 5 seconds, but not longer than 60 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 13

GM Oil Life System calculates when to change your engine oil and filter based on vehicle use. Anytime oil is changed, reset the system so it can calculate when the next oil change is required. If a situation occurs where you change your oil prior to a Change Oil Soon message being turned on, reset the system. After changing the engine oil, reset the system.

1. Display OIL LIFE RESET on the DIC.
2. Press and hold ENTER button for at least one second. An ACKNOWLEDGED display message will appear for 3 seconds or until the next button is pressed. This will tell you the system has been reset.
3. Turn key to OFF.
4. If Change Oil Soon message comes back on when you start your vehicle, engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 14

1. To display this light, press the GAGE INFO or GAGES button on the Driver Information Center (DIC). When oil life index is less than 10 percent, display will show OIL LIFE INDEX CHANGE OIL. After changing oil, reset system.
2. To reset light, display OIL LIFE INDEX. Hold RESET button for more than 5 seconds. After reset, oil life will change to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 15

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, locate reset button hole under the dash near passenger door. Use a pencil or similar object to push and hold button (inside hole) for 5 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 16

Vehicles WITHOUT Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN, with the engine off. The vehicle must be in P (Park) to access this display. Press the trip odometer reset stem until OIL LIFE REMAINING displays.
2. Press and hold the trip odometer reset stem until OIL LIFE REMAINING shows "100%." Three chimes sound and the CHANGE ENGINE OIL SOON message goes off.
3. Turn the key to LOCK/OFF. If the CHANGE ENGINE OIL SOON message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Vehicles WITH Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN position, with the engine off.
2. Press the VEHICLE INFORMATION BUTTON (i) until OIL LIFE REMAINING displays.
3. Press and hold the SET/RESET button (check-mark symbol) until "100%" is displayed. Three chimes sound (on some models) and the CHANGE ENGINE OIL SOON message goes off.
4. Turn ignition to LOCK/OFF position. If the CHANGE ENGINE OIL SOON message comes back on when engine is started, repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 17

Reset Procedure

1. Turn the ignition to ON, with the engine off.
2. Press the MODE button until the Driver Information Center (DIC) reads OIL LIFE LEFT/HOLD SET TO RESET.
3. Press and hold the SET button until 100% is displayed. You will hear three chimes and the CHANGE ENGINE OIL message will go off. Turn the key to OFF.
4. If the CHANGE ENGINE OIL message comes back on when engine is started, the engine oil life system has not reset. Repeat the procedure.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 18

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL message or light will come on. Change the engine oil as soon as possible within the next 600 miles (1 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

NOTE: Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.

Vehicles with DIC (& Steering Wheel Controls)

1. Using the DIC controls on the right side of the steering wheel (see [Fig. 1](#)), display REMAINING OIL LIFE on the driver information center (DIC).
2. Press SEL or SET/CLR (check mark icon on some systems) on the DIC controls and hold down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.

NOTE: If the CHANGE OIL message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Fig. 1: Identifying DIC Controls (Steering Wheel - Typical)

Courtesy of GENERAL MOTORS COMPANY

Vehicles with DIC (& Turn Signal Lever Controls)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button on the turn signal lever to enter the Vehicle Information Menu. Use the thumbwheel to scroll through the menu items until you reach REMAINING OIL LIFE. See [Fig. 2](#).

NOTE: On vehicles with an Uplevel DIC, the controls are at the right-hand side of the steering wheel.

3. Press the SET/CLR button (on some models, the check-symbol button) while the oil life display is active. After a few seconds, there will be a single chime (on some models) and the oil life will be reset to 100%.
4. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE OIL message is off and the REMAINING OIL LIFE 100% message is displayed.

NOTE: If the CHANGE OIL message comes back on or Code 82 DIC message comes on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Fig. 2: Identifying DIC Controls (Turn Signal Lever)

Courtesy of GENERAL MOTORS COMPANY

Vehicles without DIC (Some Models)

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

Reset Using Diagnostic Scan Tool (Some Models)

1. Turn on ignition.
2. Connect scan tool.
3. Select Module Diagnosis.
4. Select Engine Control Module.
5. Select Configuration/Reset function.
6. Select Engine Oil System Reset.
7. Push Enter button to run function.
8. Confirm Executed successfully.
9. Turn ignition off and confirm.
10. Turn ignition on and confirm.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 19

1. The Driver Information Center (DIC) will display remaining oil life as a percentage estimate of the useful life of oil.
2. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When oil life expires, display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press INFORMATION (or INFORMATION SKIP) button to display OIL LIFE LEFT. Press and hold RESET (or RESET NO) button until 100 OIL LIFE LEFT (0.0 OIL LIFE LEFT on some early models) is displayed.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20

With Base Audio System

Press up or down arrow on the INFO button located to right of Driver Information Center (DIC) display to

access DIC menu. Once 100 percent ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. Percentage will return to 100 and oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

With Navigation System

Turn the system on by pressing PWR/VOL knob once. PWR/VOL knob is located to lower left of DIC display. Press INFO button located to left of the display to access Vehicle Information menu. Turn TUNE/SEL knob located to lower right of the display until ENGINE OIL LIFE is highlighted. Press TUNE/SEL knob once to select it. When 100 percent Engine Oil Life is displayed, press multifunction button next to reset prompt in upper right corner of the display. Percentage will return to 100 and the oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 21

1. Use the SELECT knob to select OIL LIFE on the DIC menu.
2. Press SELECT to start the OIL LIFE reset procedure.
3. The DIC menu will display "Are you sure that you want to reset?" Use SELECT to choose YES to reset oil life or NO to exit and return to the previous menu.
4. If YES is selected, the DIC menu will display RESET OIL LIFE for a short time and then 100% OIL LIFE will be display when OIL LIFE is successfully reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 22

With Base Audio System

1. Press the CLR button located to the right of the driver information center (DIC) display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Press the up or down arrow on the INFO button located to the right of the Driver Information Center (DIC) display to access the DIC menu.
3. Once 100% ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
4. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

Without DIC

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

With Navigation System

1. Press the multifunction button, next to the OK prompt in the upper right of the display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Turn the system on by pressing the PWR/VOL knob once. The PWR/VOL knob is located to the lower left of the driver information center (DIC) display.

3. Press the INFO button located to the left of the display to access the Vehicle Information menu.
4. Turn the TUNE/SEL knob located to the lower right of the display until Engine Oil Life is highlighted. Press the knob once to select it.
5. Once the 100% Engine Oil Life is displayed, press the multifunction button next to the Reset prompt in the upper right corner of the display. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
6. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 23

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset service reminder on 1989 models, press RANGE button until OIL LIFE INDEX appears on display. Depress and hold in AVG ECON and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.
4. On 1990-93 models, press RANGE button until OIL LIFE INDEX appears on DIC display. Depress and hold in AVG SPEED and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 24

1. An OIL LIFE INDEX is one of 4 displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. Display will show 100 percent when the system is reset. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When the oil life expires, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press ENG DATA button until OIL LIFE INDEX appears on DIC display. Depress and hold in ENG DATA and RANGE buttons until 100 is displayed. This will reset remaining oil life to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 25

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a estimated percentage of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After performing necessary services, reset service reminder.
3. To reset service reminder, turn ignition to on position. Do not start engine. Depress and hold RANGE and FUEL USED buttons until OIL LIFE INDEX appears on DIC display. Depress and hold RANGE and RESET buttons for 5-60 seconds.
4. When CHANGE OIL SOON light flashes 4 times, remaining oil life index is reset to 100 percent. If CHANGE OIL SOON comes on and stays on for 5 seconds, display did not reset. Repeat step [3](#).

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 26

1. Oil change reminder display on the Driver Information Center (DIC) is similar to 1990-91 models, but reset procedures are different. After changing oil, reset oil life display.
2. To reset, press INFORMATION button to display OIL LIFE INDEX. Press and hold STORE/RECALL button until 100 is displayed. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 27

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of engine oil or transaxle fluid. When remaining oil or fluid life is 0 percent, the display will show CHANGE OIL NOW or CHANGE TRNS FLUID NOW. After changing engine oil or transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the OIL LIFE or TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, OIL LIFE 100 or TRNS FLUID 100 will be displayed.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 28

1. An oil change reminder displays estimated percentage of the remaining useful life of the oil. When engine is started, a tone will sound and approximate distance to next oil change will be displayed.
2. When remaining oil life is 10 percent or less, the system will calculate distance to next oil change. When the oil life is 0 percent, the display will show CHANGE OIL NOW. After changing oil, reset oil life display.
3. To reset the display, press and hold in OIL button to select the oil life display. Then, press and hold in RESET and OIL buttons for at least 5 seconds. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 29

1. To reset the display, press and release the TEST button.
2. Press and release the OIL button.
3. Press and hold the RESET button for at least 7 seconds. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 30

1. To reset the display, press and release RESET button on Driver Information Center (DIC).
2. Press SEL button (with down arrow) to select OIL.
3. Press SEL button (with left and right arrows) to display oil life.
4. Press and hold RESET button for about 5 seconds.
5. A reset message will display, then oil life will display 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 31

With Information Center Display

OIL LIFE INDEX is one of 4 engine data displays used on models with Information Center display. It will display remaining oil life as estimated percentage of the useful life of oil. It will show 100 percent when the system is reset. After changing oil, reset oil life display.

1. To reset the display, press ENG DATA button (1989-90) or OPTIONS button (1991-92) until oil life index is displayed.
2. Then, press and hold in ENG DATA and GAGE buttons (1989) or RESET/ENTER button (1990-92) for at least 5 seconds. This will reset remaining oil life to 100 percent.

With Visual Information Center

OIL LIFE is one of the displays used on models with a Visual Information Center (VIC). It will display data regarding previous oil change. A bar graph display shows full when oil is changed. Bar graph will go down as vehicle is driven and oil ages. When bar graph reaches CHANGE OIL mark, oil should be changed. After changing oil, reset oil life display.

1. To reset the display, press INFO hard key and then OIL LIFE soft key to display oil life index.
2. Press RESET soft key.
3. A reset confirmation page will appear and ask if oil has been changed. Press YES soft key to reset bar graph, and update last oil change date and mileage information.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 32

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. With the CHANGE OIL SOON message displayed, press any of the three driver information center (DIC) buttons to clear the CHANGE OIL SOON message.
2. Display OIL LIFE RESET on the DIC.
3. Press and hold the ENTER button for at least one second. An ACKNOWLEDGED display message will appear for three seconds or until the next button is pressed. This will tell you the system has reset.
4. Turn the ignition to OFF.

If the CHANGE ENGINE OIL message comes back on when you start the vehicle the Engine Oil Life System has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 33

This vehicle has a computer system that indicates when to change the engine oil and filter. This is based on a combination of factors which include engine revolutions, engine temperature, and miles driven. Based on driving conditions, the mileage at which an oil change is indicated can vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed. To reset the system:

Reset Procedure

1. Using the DIC controls on the right side of the steering wheel, display REMAINING OIL LIFE on the driver information center (DIC).

2. Press SEL (check mark icon on some systems) on the DIC controls and hold down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 34

Vehicles with Driver Information Center (DIC)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button, on the center console or right-hand steering wheel controls, to enter the Vehicle Information Menu.
3. Press either the up or down arrows to view REMAINING OIL LIFE.
4. Press the SET/CLR button until 100% is displayed.
5. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE ENGINE OIL SOON message goes off.

NOTE: If the CHANGE OIL message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Alternate Method

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, than start the vehicle.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 35

Reset the system whenever the engine oil is changed so that the system can calculate the next engine oil change. Always reset the engine oil life to 100% after every oil change. It will not reset itself. Use the DIC controls at the right side of the instrument cluster to reset the system.

1. Display remaining oil life (oil can w/ %) on the DIC
2. Press and hold SET/CLR on the DIC for more than five seconds. The oil life will change to 100%.

If the OIL CHANGE DIC message comes back on when the vehicle is started, the engine oil life system has not reset. Repeat the procedure.

EMISSIONS MAINTENANCE REMINDER (REMINDER FLAG)

NOTE: To determine the appropriate reset procedure, refer to [EMISSIONS MAINTENANCE REMINDER RESET](#). Only vehicles listed in this index have an Oxygen Sensor Reminder Flag reset.

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Some Models	
1980	Emissions Maintenance Reminder Reset Procedure

EMISSIONS MAINTENANCE REMINDER RESET PROCEDURE

- 1. Every 30, 000 miles, a reminder flag appears in speedometer face, indicating service of oxygen sensor is necessary. See [Fig. 3](#). Inspect and service oxygen sensor as necessary and reset flag.
- 2. To reset flag, remove instrument panel trim plate. Remove instrument cluster lens. Using pointed tool, apply light downward pressure on notches of flag until it is reset. An alignment mark will appear in left center of odometer window when flag is fully reset.

Fig. 3: Resetting Reminder Flag
Courtesy of GENERAL MOTORS CORP.

EMISSIONS MAINTENANCE REMINDER (WARNING LIGHT)

NOTE: To determine the appropriate reset procedure, refer to [EMISSIONS MAINTENANCE REMINDER RESET INDEX](#). Only vehicles listed in this index have an oxygen sensor warning light reset.

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Sprint	
1985-86	<u>Emissions Maintenance Reminder Reset Procedure</u>

EMISSIONS MAINTENANCE REMINDER RESET PROCEDURE

At 30, 000 mile intervals, a SENSOR light in dash will start flashing, indicating oxygen sensor needs replacement. To reset mileage counter (after sensor replacement), locate SENSOR light cancel switch on right side of fuse box. Return cancel switch to OFF position. Start engine to ensure light remains off.

EMISSIONS MAINTENANCE REMINDER (CHECK ENGINE LIGHT)

NOTE: To determine the appropriate reset procedure, refer to [EMISSIONS MAINTENANCE REMINDER RESET INDEX](#). Only vehicles listed in this index have a check engine light reset.

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Geo Tracker	
1989-94	<u>Emissions Maintenance Reminder Reset Procedure</u>

EMISSIONS MAINTENANCE REMINDER RESET PROCEDURE

Federal Emissions

1. CHECK ENGINE light functions as a service reminder indicator and emission system service. CHECK ENGINE light will come on each 50, 000 miles (PCV and EGR), each 80, 000 miles (oxygen sensor) and each 100, 000 miles (charcoal canister) to indicate needed emission system service.
2. After servicing and/or replacing components, reset CHECK ENGINE light by sliding cancel switch to its opposite position. See [CHECK ENGINE LIGHT RESET SWITCH LOCATION \(GEO TRACKER\)](#) for switch location.

CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)

Application	Location
1989-91	Behind Access Panel, Directly Below Steering Column
1992-94	⁽¹⁾ Behind Instrument Panel, Next To Left Speaker
(1) See <u>Fig. 4</u> .	

Fig. 4: Check Engine Light Reset Switch Location (1992-94 Geo Tracker - Federal Emissions)

Courtesy of GENERAL MOTORS CORP.

California Emissions

CHECK ENGINE light indicates when it is necessary to have emission system serviced, regardless of mileage. CHECK ENGINE light comes on briefly when starting as a bulb check. If light does not come on or stays on constantly, repair as necessary.

FUEL FILTER REPLACEMENT REMINDER

NOTE: To determine the appropriate reset procedure, refer to [Fuel Filter Life Reset Index](#). Only vehicles listed in this index have a fuel filter life reset.

FUEL FILTER REPLACEMENT REMINDER RESET INDEX

Application	Reset Procedure
Some Diesel Models	Fuel Filter Replacement Reminder Reset Procedure

FUEL FILTER REPLACEMENT REMINDER RESET PROCEDURE

NOTE: This procedure applies to some diesel models. Manufacturer does not specify which vehicles are equipped with a Fuel Filter Replacement Reminder.

NOTE: ALWAYS reset the FUEL FILTER LIFE system (if equipped) after a fuel filter change.

"FUEL FILTER LIFE" message will appear when a reset is performed either by using the steering wheel controls or performing manual reset procedure.

1. On vehicles with steering wheel controls, press and hold the select button for 5 seconds while the FUEL FILTER LIFE message is displayed. This message will appear on the Driver Information Center (DIC) for 10 seconds.
2. On vehicles without steering wheel controls, go to next step.
3. Without pressing the pedals, turn the ignition key to the ON position, engine off. Wait 5 seconds.
4. Completely depress the brake and accelerator pedals simultaneously and hold for 10 seconds. The system is now reset. Turn ignition key OFF.
5. On all vehicles, the next time engine is started, the message will no longer be displayed.

MAINTENANCE SERVICE REMINDER

NOTE: To determine the appropriate reset procedure, refer to [MAINTENANCE SERVICE REMINDER RESET INDEX](#). Only vehicles listed in this index have a Service Reminder reset.

MAINTENANCE SERVICE REMINDER RESET INDEX

Model & Year	Reset Procedure
6000 STE	
1987-89	<u>Maintenance Service Reminder Reset - Procedure 01</u>
Bonneville	
1988-91	<u>Maintenance Service Reminder Reset - Procedure 01</u>
Caprice	
2011	<u>Maintenance Service Reminder Reset - Procedure 02</u>

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 01

The SERVICE REMINDER message light is used on models with a Driver Information Center (DIC). After performing necessary services, reset service reminder light.

1. To reset service reminder, push DIC button until desired service item is displayed.
2. Press and hold down the DIC button. With button pressed, the distance display will decrease in increments of 500 miles.
3. Release button when desired distance is displayed on the DIC.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 02

The displayed service reminder is reset using a scan tool or by the following procedure:

1. Turn the ignition to the OFF position.
2. Press and hold the TRIP button.
3. Turn the ignition to the ON position.
4. Release the TRIP button.

5. Once in the Service Reset screen, press and hold the ENTER switch for 3-5 seconds. A confirmation beep will sound upon reset.
6. Turn the ignition to the OFF position.

NOTE: If the service reminder comes back on when you start the vehicle, the Service Reminder Display has not reset. Repeat the procedure.

TIMING BELT REPLACEMENT REMINDER

NOTE: To determine the appropriate reset procedure, refer to [TIMING BELT REPLACEMENT REMINDER INDEX](#). Only the vehicles listed in this index have a Timing Belt Replacement Reminder Reset.

CHANGE TIMING BELT MESSAGE INDEX

Model & Year	Reset Procedure
Chevrolet Cruze - 1.8L LUW and LWE Engines (2011-16)	Timing Belt Replacement Reminder Reset Procedure
Chevrolet Sonic - 1.8L LUW and LWE Engines (2012-16)	Timing Belt Replacement Reminder Reset Procedure

TIMING BELT REPLACEMENT REMINDER RESET PROCEDURE

NOTE: Applies to 1.8L LUW and LWE engines.

Description

On LUW and LWE engines, the Instrument Cluster monitors the odometer mileage to determine when a timing belt (if equipped) replacement may be necessary. After the vehicle has accumulated approximately 100, 000 miles (160, 000 kilometers), the Instrument Cluster may display the CHANGE TIMING BELT message.

Message Reset

After the engine timing belt has been replaced, reset the CHANGE TIMING BELT message by locating and removing the fuses that supply power to the Instrument Cluster, for two minutes.

- **2011-16 Cruze :** Fuse #21 (F21DA) Underhood ([Fig. 5](#))
- **2012-16 Sonic :** Fuse #F26 (F26DA) Under Dash (lower-left of dash - [Fig. 6](#))

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 01

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due. Change fluid in both the oil pan and side cover.

1. To reset display, turn ignition ON with engine OFF.
2. On the climate control panel, press and hold OFF and REAR DEFOG buttons until TRANS FLUID RESET message appears in DIC (about 5-20 seconds).

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 02

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due. Percentage of transaxle fluid life remaining may be checked at any time by pressing INFO button

several times until TRANS FLUID LIFE message appears.

- 1. To reset display, turn ignition key ON with engine OFF.
- 2. Press the INFO button until TRANS FLUID LIFE message appears.
- 3. Press and hold INFO RESET button until display shows 100 percent TRANS FLUID LIFE. Transaxle fluid life index is now reset.

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 03

NOTE: The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due.

Resetting With Base Audio System

Press CLR button located to the right of the DIC display to acknowledge the CHANGE TRANS FLUID message. This will clear the message from the display and reset it. To reset transmission fluid life indicator, press up or down arrow on INFO button located to the right of the DIC display to access the DIC menu. Once percentage TRANS FLUID LIFE menu item is highlighted, press and hold CLR button. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

Resetting With Navigation System

Press multifunction button located to the right of the DIC display, next to the OK prompt to acknowledge the CHANGE TRANS FLUID message. This will clear the message from the display and reset it. To reset transmission fluid life indicator, turn system on by pressing PWR/VOL knob once. PWR/VOL knob is located to the lower left of the DIC display. Press INFO button located to the left of the DIC display to access the VEHICLE INFO menu. Turn TUNE/SEL knob located to the lower right of the DIC display until TRANS FLUID LIFE is highlighted. Press knob once to select it. Once percentage TRANS FLUID LIFE is displayed, press multifunction button next to the RESET prompt in the upper right corner of the display. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 04

- 1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of transaxle fluid. When remaining fluid life is 0 percent, the display will show CHANGE TRNS FLUID NOW. After changing transaxle fluid, reset oil life display.
- 2. To reset the display, turn ignition on with engine off. Press ENG button to select the TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
- 3. The word RESET will appear. Then, TRNS FLUID 100 will be displayed.

TIRE PRESSURE MONITOR SYSTEM REMINDER

NOTE: To determine the appropriate reset procedure, refer to **TPMS REMINDER RESET INDEX**. Only vehicles listed in this index have a TPMS Reminder Reset.

(1) This is an Indirect TPM System. A tire sensor activation tool is not required for this procedure.		
(2) A tire sensor activation tool cannot be used for this procedure.		

TPMS REMINDER RESET - PROCEDURE 01

- NOTE:** When the wheels have been rotated, or a tire pressure sensor or EGM/LGM has been replaced, retrain tire pressure sensors.
- NOTE:** The DIC will display the "SERVICE TIRE MONITOR" message if one or more of the tire pressure sensors has malfunctioned or if all of the sensors have not been programmed successfully. If, after the relearn procedure, the warning indicators are still on, there is a problem in the TPM system.
- NOTE:** If this procedure is performed following replacement and reprogramming of the Liftgate Module (LGM), DIC may display a low tire pressure fault and all tire pressures read 0 psi. If this problem occurs, see appropriate manufacturer service information.
- NOTE:** The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the system has been in learn mode for more than 5 minutes. If the learn mode is canceled before any sensor has been learned, the EGM/LGM will remember all current sensor IDs and their locations. As soon as the first sensor ID code is learned, all other IDs are erased from the EGM/LGM's memory. On models that display the individual tire pressure on DIC, updated tire pressures will not be displayed until EGM/LGM receives 2 more valid transmissions from each sensor.
- NOTE:** Before proceeding with the steps below, ensure that no other sensor learn procedure is being performed simultaneously, or that tire pressures are not being adjusted on a TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF. Apply parking brake.

NOTE: If Learn Mode cannot be enabled, TPM system is not enabled in EGM/LGM. See appropriate manufacturer service information.

3. To enable Learn Mode, turn headlight switch from OFF to parking lamps 4 times within 4 seconds. A double horn chirp will sound and the low tire pressure indicator will begin to flash to indicate the learn mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.
7. Test drive the vehicle above 25 mph for at least 2 minutes before viewing tire pressures on DIC.

TPMS REMINDER RESET - PROCEDURE 02

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the TPM system may not function properly:

- If one or more of the tire pressure sensors are missing or inoperable.
- A compact spare tire is used.

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.

NOTE: The relearn procedure must be completed within 15 minutes from when the vehicle is stationary after being driven at 20 mph (32 km/h), or greater, for 10 seconds.

NOTE: The learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the learn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the learn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the RCDLR memory.
- If equipped, the DIC will display dashes instead of tire pressures.

- **DTC C0775 will be set.**

These conditions will now require the learn procedure to be repeated for the system to function properly.

Ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray

IMPORTANT: sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Turn ignition switch to ACC position. Apply parking brake.
2. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
3. To enable Learn Mode:
 - On vehicles equipped with keyless entry, simultaneously press the keyless entry transmitters lock and unlock buttons until a double horn chirp sounds indicating the Learn Mode has been enabled. On vehicles with DIC, a TIRE LEARN message may be displayed. The left front turn signal will also be illuminated.
 - On vehicles not equipped with keyless entry, press and release the driver information center (DIC) INFO button until the TIRE LEARN message appears on the DIC display. Press and hold the SET/RESET button until a double horn chirp sounds indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.
4. Ignition ON.
5. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
6. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 03

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: In vehicles without the "UH3" option, each turn signal will illuminate one at a time indicating which location is to be learn.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turned to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ACC position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.

NOTE: The left front turn signal will also illuminate to indicate the learn mode has been enabled.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 04

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are

erased from the RCDLR's memory.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.

NOTE: If the TPM Learn Mode cannot be enabled, ensure the TPM option is enabled in the RCDLR. See appropriate manufacturer service information.

3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.

NOTE: If a horn chirp does not sound after 15 seconds, remove, then re-apply TPM sensor relearn magnet.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 05

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 06

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Press RESET button on DIC in order to clear any warning messages.
4. Press and release OPTIONS button until display is blank.
5. Press and hold RESET button for 3 seconds.

NOTE: If the DIC does not display "TIRE TRAINING" message, ensure TPM option is enabled in the RCDLR. See appropriate manufacturer service information.

6. Press and release OPTIONS button until "TIRE TRAINING" is displayed.
7. Press and release RESET button. The DIC should display "LEARN L FRONT TIRE", verifying Learn Mode has been enabled.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.

9. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
10. Turn the ignition switch to OFF position to exit the learn mode.

TPMS REMINDER RESET - PROCEDURE 07

- NOTE:** An OEM scan tool or Pressure Increase/Decrease Method is used to perform this procedure.
- NOTE:** Before proceeding with this process, ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a scan tool, initiate the TPM Learn Mode.
3. Perform the procedure by following the menu selections. A double horn chirp will sound and the IPC tire pressure monitor indicator warning lamp icon will flash indicating Learn Mode is enabled.
4. Starting with the left front tire, active the sensors by one of the following methods:
 - Hold the antenna of the scan tool, aimed upward, against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button and wait for a horn chirp. Once the horn chirp has sounded, the sensor information is learned.
 - Increase/decrease the tire pressure for 8-10 seconds then wait for a horn chirp. The horn chirp may occur before or up to 30 seconds after the 8-10 second pressure increase/decrease time period has been reached. Once the horn chirp has sounded, the sensor information has been learned.
5. After the horn chirp has sounded, repeat step 4 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
6. After the left rear sensor is learned, a double horn chirp will sound indicating all sensor IDs have been learned and the tire pressure module will exit the Learn mode turning OFF the IPC tire pressure monitor warning indicator lamp icon.
7. Ignition OFF, adjust all tires to the recommended pressures. Refer to the tire placard label.

TPMS REMINDER RESET - PROCEDURE 08

Automatic Sensor Learn Process

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. When a tire is installed, the vehicle must be stationary for about 20 minutes before the system recalculates. The following

relearn process takes up to 10 minutes, driving at a minimum speed of 12 mph (19 km/h). A dash (-) or pressure value will display in the DIC. A warning message displays in the DIC if a problem occurs during the relearn process.

TPMS REMINDER RESET - PROCEDURE 09

- NOTE:** For Cadillac CTS with RPO UH3, use this procedure. For CTS without RPO UH3, see Procedure 10.
- NOTE:** If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.
- NOTE:** When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.
- NOTE:** The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turned to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.
- NOTE:** Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to RUN position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled. On some models, a TIRE LEARNING ACTIVE message may also be displayed on the DIC screen.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 10

- NOTE:** For Cadillac CTS without RPO UH3, use this procedure. For CTS with RPO UH3, see Procedure 9.

- NOTE:** If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.
- NOTE:** When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.
- NOTE:** The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turned to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.
- NOTE:** Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Depending on ignition type:
 - With standard ignition switch, place the switch in the RUN position.
 - With electronic keyless ignition, place the switch in the ACC position.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 11

NOTE: This procedure is for vehicles with an Uplevel DIC.

When a low tire pressure condition is detected, the TPMS illuminates the low tire pressure warning light on the instrument cluster. A message to check the pressure in a specific tire displays in the Driver Information Center (DIC). The low tire pressure warning light and the DIC warning message come on at each ignition cycle until the tires are inflated to the correct inflation pressure. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go

off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Place the vehicle power mode in ON/RUN/START.
4. Make sure the Tire Pressure info display option is turned on. The info displays on the DIC can be turned on and off through the Settings menu.
5. Use the five-way DIC control on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SEL button located in the center of the five-way DIC control. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Press STOP to turn the ignition off.

TPMS REMINDER RESET - PROCEDURE 12

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Use the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC). Use the arrow keys to scroll to the Tire Pressure screen
5. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
6. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.

8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Turn the ignition to LOCK/OFF.

TPMS REMINDER RESET - PROCEDURE 13

LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or when vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. There are 2 ways to reset the tire inflation monitor. To reset the tire inflation monitor using the exterior or interior lamp controls, go to step 4. To reset tire inflation monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine OFF. Press and hold the TUNE DISP button on the radio for at least 5 seconds until settings is displayed.
2. To scroll through the main menu:
 - On Impala, press the SEEK PTYPE up or down arrow.
 - On Monte Carlo, press the SEEK PSCAN up or down arrow.On all models, scroll until TIRE MON appears on the display. Press the 1 PREV or 2 NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message has been reset, scroll through the menu until EXIT appears on the display. Press the TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. Reset the tire inflation monitor:
 - On Impala, using the interior lighting controls, turn the switch from OFF to ON position 3 times with ignition switch in ON position.
 - On Monte Carlo, using the exterior lighting controls, turn the switch from OFF to parking lamps 3 times with ignition switch in ON position.

TPMS REMINDER RESET - PROCEDURE 14

NOTE: There are 3 different ways to reset the Tire Pressure Monitor (TPM) system. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the 3 speed ranges to complete the calibration process.

Using Exterior Lamp Switch

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Cycle the exterior lamp switch from OFF to parking lamps 3 times within 5 seconds.
4. Use the scan tool in order to clear the TPM DTC.

Using RDS Radio, If Equipped

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn the ignition to ACC or ON, with the engine OFF.
3. Turn the radio OFF.
4. Press and hold the DISP button until SETTINGS is displayed.
5. Press the SEEK up or down arrows until TIRE MON is displayed.
6. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
7. Press the DISP button, A chime will sound and DONE will be displayed.
8. Scroll until EXIT is displayed.
9. Press the DISP button to exit the TPM reset mode. A chime will sound to verify exit.
10. Use the scan tool in order to clear the TPM DTC.

Using Scan Tool

1. Adjust all tire pressures to the recommended kPa/psi.
2. Install the scan tool.
3. Turn ignition ON with engine OFF.
4. With the scan tool select Special Functions.
5. Select TIM Reset.
6. Press the Reset soft key.
7. Use the scan tool in order to clear the TPM DTC.

TPMS REMINDER RESET - PROCEDURE 15

CHECK TIRE PRESSURE or TIRE PRESS message will come on if air pressure in one tire is lower than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Message will stay on until system is recalibrated. Check and adjust air pressure in all 4 tires before recalibrating system.

NOTE: If vehicle is equipped with Systems Monitor, go to step 2.

1. To recalibrate vehicle equipped with Driver Information Center (DIC), turn ignition ON with engine OFF. Using the MODE and SELECT button on DIC, change display until TIRE PRESSURE appears. Press and hold RESET button for 5 seconds. TIRE PRESSURE RESET should now appear on display. If TIRE PRESSURE RESET does not appear on display after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.
2. To recalibrate vehicle equipped with Systems Monitor, turn ignition ON with engine OFF. Press and hold TIRE PRESS RESET button for 5 seconds. TIRE PRESS light on the Systems Monitor should begin to flash. Release the TIRE PRESS RESET button. TIRE PRESS light should go out and system is now reset. If TIRE PRESS light does not begin to flash after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.

TPMS REMINDER RESET - PROCEDURE 16

CHECK TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting

system.

1. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
2. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the CHECK TIRE PRESSURE indicator light will begin to flash. While the CHECK TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If CHECK TIRE PRESSURE light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS REMINDER RESET - PROCEDURE 17

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

NOTE: When the low tire pressure warning messages appear, immediately check air pressure of all tires and adjust to the specified pressure. If warning messages are still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the system may not function properly:

- More than one tire is low.
- Only one tire is replaced with a new tire during service.
- Vehicle is moving faster than 65 mph (105 km/h).
- The system is not yet calibrated.
- Tire treadwear is uneven.
- Compact spare tire is installed.
- Tire chains are being used.
- Vehicle is being driven on a rough or frozen road.
- If ABS warning light is on.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

NOTE: There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:

- *Using DIC Reset Button* (if no scan tool is available)
- *Using Scan Tool* (if an OBD-II compatible scan tool is available).

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press SELECT right arrow button until "GAGE" is displayed.
5. Press SELECT down arrow button until "TIRE PRESSURE" is displayed.
6. Press and hold RESET button until "TIRE PRESSURE RESET" is displayed.
7. Release RESET button. DIC should display "TIRE PRESSURE NORMAL".
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select "SPECIAL FUNCTIONS".
5. Select "TIRE PRESSURE RESET".
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS REMINDER RESET - PROCEDURE 18

The Tire Pressure Monitor (TPM) system alerts the driver when a large change in the pressure of one tire exists, while the vehicle is being driven. The TPM system uses the Electronic Brake Control Module (EBCM), ABS wheel speed sensor inputs, class 2 serial data circuit, and the Driver Information Center (DIC) to perform the system functions. The EBCM contains software to calculate relative tire pressure differences. The software requires approximately 30 minutes of straight line driving in 3 different speed ranges to complete the calibration process to have full capability for detecting a tire pressure condition. The speed ranges are 15-40 mph, 40-70 mph and 70-90 mph.

1. LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or if vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.
2. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
3. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the LOW TIRE PRESSURE indicator light will begin to flash. While the LOW TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If the LOW TIRE PRESSURE indicator light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS REMINDER RESET - PROCEDURE 19

NOTE: After resetting, the tire pressure monitoring (TPM) system requires 60 minutes or more of driving at a speed of 30 km/h (19 mph) or above to complete the calibration process to have full capability for detecting a tire pressure condition.

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Press and hold the tire pressure warning reset switch until the tire pressure warning indicator blinks 3 times at one second intervals.
4. If the tire pressure warning indicator does not blink, repeat the procedure starting at step 2.
5. Drive the vehicle for 60 minutes or more at a speed of 30 km/h (19 mph).
6. Verify the system has initialized. Turn ignition ON with engine OFF and observe the tire pressure warning indicator.
 - System Initialized: light on for 3 seconds.
 - System not initialized: light on for 4 seconds.

TPMS REMINDER RESET - PROCEDURE 20

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure

has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

NOTE: When the tire pressure warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning message is still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the system may not function properly:

- More than one tire is low.
- Vehicle is moving faster than 65 mph (105 km/h).
- The system is not yet calibrated.
- Tire treadwear is uneven.
- Compact spare tire is installed.
- Tire chains are being used.
- Vehicle is being driven on a rough or frozen road.
- If ABS warning light is on.

NOTE: There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:

- *Using DIC Reset Button* (if no scan tool is available)
- *Using Scan Tool* (if an OBD-II compatible scan tool is available).

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold appropriate button (located on left side of steering column) until "TIRE PRESSURE" message appears on display:
 - 1997-99 models: Press and hold GAGES button
 - 2000-05 models: Press and hold GAGES INFO button
5. Press and hold RESET button for 5 seconds. After 5 seconds, "TIRE PRESSURE RESET" message should appear on display.
6. Release RESET button. A "TIRE PRESSURE NORMAL" message should appear on display.
7. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).

- 40-70 mph (64-113 km/h).
- 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select SPECIAL FUNCTIONS.
5. Select TIM RESET.
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS REMINDER RESET - PROCEDURE 21

Using Reset Button (1999-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Press and hold the red RESET button located in the passenger side instrument panel fuse block.
3. The LOW TIRE indicator will flash 3 times, then turn off.
4. Use scan tool to clear the TPM DTC.

Using Scan Tool (2003-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Install scan tool. Turn ignition ON with engine OFF.
3. With scan tool, select Special Functions.
4. Select TIM Reset.
5. Press Reset soft key.
6. LOW TIRE indicator will flash 3 times, then turn OFF.
7. Clear the TPM DTC.

TPMS REMINDER RESET - PROCEDURE 22

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button chime sounds and "TIRE PRESSURE RESET" is displayed and a chime sounds 3 times.
6. Release SET button and DIC will display "TIRE PRESSURE NORMAL".

NOTE: If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure. If it does not work after two tries, refer to appropriate service information.

7. After resetting, the TPM system requires up to 5 miles of driving in each of the following speed ranges to complete the calibration process:
 - 25-40 mph (40-64 km/h).
 - 40-60 mph (65-96 km/h).
 - 60-85 mph (96-136 km/h).

NOTE: Learning process does not need to be completed during a single trip.

TPMS REMINDER RESET - PROCEDURE 23

1. Check and adjust air pressure in all 4 tires before resetting system. Refer to tire placard located on the

inside edge of the driver's door. Turn ignition ON, with engine OFF.

2. Press the MODE button on the Driver Information System until LOW TIRE PRESSURE HOLD SET TO RESET is displayed.
3. Press and hold the SET button until a chime sounds and TIRE PRESSURE RESET is displayed and a chime sounds 3 times.
4. Release the SET button and TIRE PRESSURE NORMAL will be displayed.

TPMS REMINDER RESET - PROCEDURE 24

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button until a chime sounds and "TIRE PRESSURE RESET" is displayed.
6. System will now sound a chime 3 times, and DIC will display "TIRE PRESSURE NORMAL".

NOTE: If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure.

7. After resetting, the TPM system requires up to 5 miles (8 km) of flat, smooth road, straight line driving in each of the 4 speed ranges (about 10-20 minutes in each range) to complete the calibration process:
 - 19-40 mph (31-65 km/h).
 - 40-59 mph (65-95 km/h).
 - 59-74.5 mph (95-120 km/h).
 - 74.5-90 mph (120-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Calibration Mode, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Detection Mode, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS REMINDER RESET - PROCEDURE 25

NOTE: **This procedure is for vehicles with a Base DIC.**

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions using a TPMS relearn tool. There are two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See [Fig. 7](#).
4. Use the MENU button to select the VEHICLE INFORMATION MENU in the Driver Information Center (DIC). See [Fig. 8](#).
5. Use the thumbwheel (or up and down arrows) to scroll to the TIRE PRESSURE MENU item screen.
6. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

 Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 26

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.

4. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
5.
 - **Up-Level DIC** : Use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page.
 - **Base-Level DIC** : Use the TRIP ODOMETER RESET stem to scroll to the TIRE PRESSURE screen.
6.
 - **Up-Level DIC** : Press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls.
 - **Base-Level DIC** : Press and hold the TRIP ODOMETER RESET stem for about five seconds. A message asking if the process should begin should appear. Select YES and press the TRIP ODOMETER RESET stem to confirm the selection.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 27

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ON/RUN position, with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled. The TIRE LEARNING ACTIVE message displays on the DIC screen.

NOTE: If the vehicle does not have RKE, press the Driver Information Center (DIC) vehicle information button until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen. If the vehicle does not have RKE or DIC buttons, press the trip odometer reset stem on the instrument cluster until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS

message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 28

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See [Fig. 7](#).
4. Make sure the Tire Pressure info page option is turned on. The info pages on the Driver Information Center (DIC) can be turned on and off through the Settings menu.
5. Use the DIC controls on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SET/RESET button (check mark symbol) located in the center of the DIC controls.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 29

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button (right-hand side of instrument cluster) once on the Driver Information Center (DIC).
5. Press the up or down arrow button until the Tire Learn screen is displayed.
6. Press and hold the SET/CLR button to begin the sensor matching process.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 30

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Put the vehicle in ON/ RUN and place the vehicle in P (Park).
4. If the Driver Information Center (DIC) display is minimized, press the SELECT knob to maximize it. See [Fig. 9](#).
5. Use the SELECT knob to scroll to the Tire Pressure display screen.
6. Press and hold the SELECT knob for five seconds to begin the sensor matching process. A message displays confirming to begin the process.
7. Use the SELECT knob to select YES with the highlighted selection, and press the SELECT knob again to confirm the selection.

8. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
9. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
10. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
11. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

Fig. 9: Identifying DIC Controls (Spark EV)

Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 31

NOTE: You have two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Enter the learn sequence from the TPM Learn screen, located under the Customization Menu in the instrument panel cluster. Press SRCE button until you see Customize Options and then press ENTER (left pointing arrow). Move the thumbwheel up or down to scroll through the available options. Press ENTER to select an item. To exit the current menu, or go back, use the thumbwheel to select BACK (left arrow) at the top of the screen and then press ENTER.
5. Start with the driver side front tire. The driver side front indicator lamp also comes on to indicate that corner's sensor is ready to be learned. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor

identification code has been matched to this tire and wheel position

6. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After the driver side rear TPMS sensor has been learned the horn chirps two times. The driver side rear indicator lamp turns off and the TPMS sensor matching process is done. Turn the ignition switch to LOCK/OFF.

Fig. 10: Identifying DIC Controls

Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 32

NOTE: An OEM or generic TPMS sensor activation tool is used to perform this procedure.

NOTE: The sensor learn procedure must be performed after every tire rotation, tire pressure indicator module replacement, or sensor replacement. Make sure the TPM sensor activation tool battery is sufficient to complete TPM learn process. Do not place the TPM tool directly on the valve stem. The TPM tool should be placed against the tire sidewall near the valve stem. The TPM sensor learn activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. The low tire pressure warning light will start to flash to indicate the learn mode has been enabled. The front and back turn signals will flash twice when a sensor has been learned.

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a sensor activation tool, initiate the TPM Learn Mode.

3. Starting with the left front tire, active the sensor by holding the antenna of the tire pressure sensor activation tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for the front and back turn signals to flash twice. If the front and back turn signals do not flash, repeat the sensor activation sequence with the tool. Once the front and back turn signals have flashed twice, the sensor information is learned.

NOTE: Follow the sensor order listed here since there is no visual indicator on the vehicle for the sensor learn order.

4. After the front and back turn signals have flashed twice, repeat step 2 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
5. When the left rear sensor has been learned, the front and back turn signals will flash twice, the learn process is complete and the tire pressure indicator module exits the Learn mode.

TPMS REMINDER RESET - PROCEDURE 33

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC).
5. Use the arrow keys to scroll to the Tire Pressure screen.
6. Press the SET/CLR button to begin the sensor matching process. A message should display requesting acceptance of the process.
7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 34

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS

receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn the ignition to ON/RUN with the engine OFF. Set the parking brake.
3. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
4.
 - **Up-Level DIC** : Use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page.
 - **Base-Level DIC** : Use the MENU button to select the Vehicle Information menu in the DIC. Use the thumbwheel to scroll to the Tire Pressure Menu item screen. See [Fig. 8](#).
5.
 - **Up-Level DIC** : Press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls.
 - **Base-Level DIC** : Press the SET/CLR button to begin the sensor matching process. A message asking if the process should begin should appear. Press the SET/CLR button again to confirm the selection.
6. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
8. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Turn the ignition switch to LOCK/OFF.
11. Set all four tires to the recommended air pressure level as indicated on the Tire and Loading Information label.

DIAGNOSTIC INFORMATION AND PROCEDURES

SEAT BELT SYSTEM OPERATIONAL AND FUNCTIONAL CHECKS

NOTE: If the vehicle has been in a collision, refer to [Repairs and Inspections Required After a Collision](#) for additional information.

Perform the following inspection from the driver seat:

1. Turn the ignition switch to the ON position. Verify proper operation of the seat belt reminder lamp with the belt buckled and with the belt unbuckled.
2. Inspect the shoulder belt guide in order to ensure that the following conditions are met:
 - The shoulder belt guide swivels freely.
 - The seat belt webbing is seated flat in the guide slot.
 - The seat belt webbing does not bind.
3. Verify that the seat belt buckle faces inboard and is accessible.
4. Verify that the seat belt retractor units are securely attached.
5. Verify that the seat belt anchor bolts are secure.
6. Fully extend the seat belt webbing. Verify that the seat belt webbing does not have any twists or tears.

7. Allow the seat belt webbing to retract. Verify that the seat belt webbing returns freely and completely back into the retractor. If the seat belt webbing will not retract, refer to [Seat Belt Does Not Retract](#).
8. Snap the seat belt latch plate into the buckle.
9. Sharply tug on the seat belt latch plate and the buckle. Verify that the seat belt latch plate and the buckle remain locked when tugged.
10. Push the button on the buckle:
 - Verify that the seat belt latch plate releases easily from the buckle.
 - Verify that the button returns to its original position.

Perform the following inspection procedure from the passenger seat.

1. Verify the automatic locking retractor (ALR) feature operates properly by performing the following checks:
 1. Pull the seat belt all the way out of the retractor until it stops.
 2. Slowly allow the belt to retract partially, while listening for a ratcheting sound.
 3. Sharply tug on the belt ensuring that the retractor lock sets and does not allow the belt to be pulled from the retractor.
 4. After performing steps 1.1 through 1.3 ensure the belt fully retracts.
2. Repeat the inspection procedure steps 2 through 10 from the passengers seat.

Perform the following steps in order to inspect the left and right rear seat belts:

1. Inspect the shoulder belt guide in order to ensure that the following conditions are met:
 - The seat belt webbing is seated flat in the guide slot.
 - The seat belt webbing does not bind.
2. Verify that the seat belt buckle is accessible.
3. Verify that the seat belt retractor units are securely attached.
4. Verify that the seat belt anchor bolts are secure.
5. Fully extend the seat belt webbing. Verify that the seat belt webbing does not have any twists or tears.
6. Allow the seat belt webbing to retract. Verify that the seat belt webbing returns freely and completely back into the retractor.
7. Snap the seat belt latch plate into the buckle.
8. Sharply tug on the seat belt latch plate and the buckle. Verify that the seat belt latch plate and the buckle remain locked when tugged.
9. Push the button on the buckle:
 - Verify that the seat belt latch plate releases easily from the buckle.
 - Verify that the button returns to its original position.

Emergency Locking Retractors

WARNING: Perform this test in an area clear of other vehicles or obstructions. Do not conduct this test on the open road. A large, empty parking lot is suitable. Failure to observe this precaution may result in damage to the vehicle and

possible personal injury.

1. Fasten the seat belts, an assistant is needed when the retractor under test is not part of the driver seat belt.
2. Accelerate the vehicle slowly to 16 km/h (10 mph) and apply the brakes firmly.
3. Verify that the seat belt locks when braking firmly.

NOTE: When performing this check, note the position that the retractors are mounted. Some retractors are not mounted at a zero degree inclination.

4. If the belt does not lock, proceed with the following steps:
 1. Remove the seat belt retractor assembly.
 2. Tilt the seat belt retractor slowly.

Fig. 2: Checking Seat Belt Retractor Inclination
Courtesy of GENERAL MOTORS COMPANY

3. Ensure that the seat belt webbing can be pulled from the retractor at an inclination of 15 degrees forward or less, from the retractors mounted position.

4. Ensure the retractor cannot be pulled from the retractor at an inclination of 45 degrees forward or more.
5. If a seat belt retractor does not operate as described, replace the retractor assembly.

DTC B0072 OR B0073: DRIVER/PASSENGER SEAT BELT SWITCH

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category

DTC Descriptors

DTC B0072

Driver Seat Belt Switch

DTC B0073

Passenger Seat Belt Switch

For symptom byte information refer to [Symptom Byte List](#) .

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Driver Seat Belt Sensor Control	B0072 02, B0072 0B	B0072 04, B0072 06, B0072 0C	B0072 04, B0072 06	B0072 01, B0072 05	B0072 08
Passenger Seat Belt Sensor Control	B0073 02, B0073 0B	B0073 04, B0073 06, B0073 0C	B0073 04, B0073 06	B0073 01, B0073 05	B0073 08

Circuit/System Description

The inflatable restraint seat belt buckle switch is within the seat belt buckle and provides an input to the Inflatable Restraint Sensing and Diagnostic Module (SDM). The Inflatable Restraint Sensing and Diagnostic Module supplies a low reference circuit and a seat belt switch signal circuit to determine a buckled or unbuckled condition. The Inflatable Restraint Sensing and Diagnostic Module monitors the seat belt switch circuits and if a fault is detected a DTC will be set.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0072 01 or B0073 01

The seat belt switch circuit is shorted to voltage.

B0072 02 or B0073 02

The seat belt switch circuit is shorted to ground.

B0072 04 or B0073 03

The seat belt switch circuit is open.

B0072 05 or B0073 05

The seat belt switch circuit is shorted to voltage or open.

B0072 06 or B0073 06

The seat belt switch circuit is shorted to ground or open.

B0072 08 or B0073 08

The seat belt switch signal is invalid.

B0072 0B or B0073 0B

The seat belt switch signal is above threshold.

B0072 0C or B0073 0C

The seat belt switch signal is below threshold.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module will store a DTC and illuminate the Air Bag indicator in the instrument cluster.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Circuit/System Verification

1. Vehicle ON.
2. Verify the appropriate scan tool Seat Belt Status parameter changes between Buckled and Unbuckled when the seat belt is buckled and unbuckled.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **B153D Seat Belt Buckle-Driver**
- **B153P Seat Belt Buckle-Passenger**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Vehicle OFF, disconnect the harness connector at the appropriate B153 Seat Belt Buckle.
2. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 5 Ω**
3. Vehicle ON.
4. Verify the appropriate scan tool Seat Belt Status parameter is Buckled.
 - **If not Buckled**

1. Vehicle OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
- **If Buckled**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.
6. Verify the appropriate scan tool Seat Belt Status parameter is Unbuckled.
 - **If not Unbuckled**
 1. Vehicle OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, Vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If Unbuckled**
7. Test or replace the B153 Seat Belt Buckle.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B153 Seat Belt Buckle.
2. Test for infinite resistance between the signal terminal 2 and the low reference terminal 1.
 - **If less than infinite resistance**

Replace the B153 Seat Belt Buckle.
 - **If infinite resistance**
3. Insert the seat belt into the buckle.
4. Test for less than 5 Ω between the signal terminal 2 and the low reference terminal 1.
 - **If 5 Ω or greater**

Replace the B153 Seat Belt Buckle.
 - **If less than 5 Ω**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Front Seat Belt Buckle Replacement**

DTC B059A: PASSENGER SEAT BELT INDICATOR CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category

DTC Descriptors

DTC B059A 01

Passenger Seat Belt Indicator Circuit Short to Battery

DTC B059A 02

Passenger Seat Belt Indicator Circuit Short to Ground

DTC B059A 04

Passenger Seat Belt Indicator Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Seat Belt Indicator Control	B059A 02	B059A 04	B059A 01	-

Circuit/System Description

The Inflatable Restraint Sensing and Diagnostic Module (SDM) monitors the passenger seat status and the passenger seat belt buckle switch and provides an output to the passenger seat belt indicator. When the Inflatable Restraint Sensing and Diagnostic Module detects the passenger seat is occupied and the seat belt is not fastened, the Inflatable Restraint Sensing and Diagnostic Module supplies a pulse width modulated signal to control the passenger seat belt indicator circuit. The Inflatable Restraint Sensing and Diagnostic Module monitors the passenger seat belt indicator circuits and if a fault is detected a DTC will be set.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B059A 01

The passenger seat belt indicator circuit is shorted to voltage.

B059A 02

The passenger seat belt indicator circuit is shorted to ground.

B059A 04

The passenger seat belt indicator circuit is open.

Action Taken When the DTC Sets

The Inflatable Restraint Sensing and Diagnostic Module will store the DTC.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **S48B Multifunction Switch - Overhead Console.**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Ignition OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.

2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
 - **If 10 Ω or greater**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 13 and ground, ignition ON.
4. Verify the test lamp turns OFF and ON when the passenger seat belt is buckled and unbuckled with occupant in seat.
 - **If the test lamp is always on**
 1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1V or greater, repair the short to voltage on the circuit.
 - If less than 1V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If the test lamp is always off**
 1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the seat belt switch signal circuit terminal 45 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If test lamp turns on and off while changing between the commanded states**
5. Test or replace the S48B Multifunction Switch - Overhead Console.

SYMPTOMS - SEAT BELTS

NOTE: Review the seat belt system description and operation in order to familiarize yourself with the system and how it functions. Refer to [Seat Belt System Description and Operation](#).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat belt system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to the following symptom diagnostic procedure in order to diagnose the symptom:

- [Seat Belt Indicator Malfunction - Driver](#)
- [Seat Belt Indicator Malfunction - Passenger](#)
- [Seat Belt Indicator Malfunction - Rear](#)

SEAT BELT DOES NOT RETRACT

1. Grab the seat belt webbing and slowly and firmly extract 15 - 25 mm (5/8 - 1 in) of webbing from the seat belt.
2. Release the seat belt and allow the webbing to slowly retract back into the retractor.
3. Check to see if the seat belt is released. If the seat belt is not released, repeat steps 1 and 2, two times more.
4. If the retractor does not release after repeating the steps, replace with a new retractor.

SEAT BELT INDICATOR MALFUNCTION - DRIVER

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Driver Seat Belt Switch Signal	1	2	2	2	-
Driver Seat Belt Switch Low Reference	-	2	2	2	-
1. Indicator will remain ON with seat belt buckled. 2. Indicator will illuminate only for the bulb check.					

Circuit/System Description

The driver seat belt switch is a 2-wire switch wired to the Inflatable Restraint Sensing and Diagnostic Module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed,

and when the seat belt is buckled the switch is open. The SDM sends the status of the driver seat belt via serial data to the instrument panel cluster. After receiving the message, the instrument panel cluster controls the illumination of the driver seat belt indicator.

Circuit/System Verification

1. Command the instrument cluster all indicators ON and OFF with a scan tool. The driver seat belt indicator should turn ON and OFF as commanded.
 - **If the driver seat belt indicator does not turn ON and OFF as commanded**

Replace the P16 Instrument Cluster.
 - **If the driver seat belt indicator does turn ON and OFF as commanded**
2. Monitor the scan tool Driver Seat Belt Switch parameter while buckling and unbuckling the seat belt. The parameter should display Buckled and Unbuckled when changing seat belt states.
 - **If the scan tool Driver Seat Belt Switch parameter does not display Buckled and Unbuckled when changing seat belt states**

Refer to Circuit/System Testing.
 - **If the scan tool Driver Seat Belt Switch parameter does display Buckled and Unbuckled when changing seat belt states**
3. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **B153D Seat Belt Buckle - Driver**
- **Seat belt switch harness connector**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

1. Vehicle OFF.
2. Disconnect the harness connector at the B153D Seat Belt Buckle - Driver.
3. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
 - **If 5 Ω or greater**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 5 Ω**
4. Vehicle in Service Mode.
5. Verify the scan tool Driver Seat Belt Status parameter displays Buckled.
 - **If the scan tool Driver Seat Belt Status parameter does not display Buckled**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the seat belt switch signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If the scan tool Driver Seat Belt Status parameter does display Buckled**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
7. Verify the scan tool Driver Seat Belt Status parameter displays Unbuckled.
 - **If the scan tool Driver Seat Belt Status parameter does not display Unbuckled**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Vehicle in Service Mode.
 3. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 4. Test for less than 2 Ω in each circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If the scan tool Driver Seat Belt Status parameter does display Unbuckled**

8. Replace the B153D Seat Belt Buckle - Driver.

Component Testing

1. Vehicle OFF.
2. Disconnect the harness connector at the B153D Seat Belt Buckle - Driver, buckle the driver seat belt.
3. Test for infinite resistance between the signal circuit terminal 1 and the ground terminal 2 at the B153D Seat Belt Buckle - Driver.

- **If there is not infinite resistance**

Replace the B153D Seat Belt Buckle - Driver.

- **If there is infinite resistance**

4. Unbuckle the driver seat belt.
5. Test for less than 1 Ω between the signal circuit terminal 1 and the ground terminal 2 at the B153D Seat Belt Buckle - Driver.

- **If 1 Ω or greater**

Replace the B153D Seat Belt Buckle - Driver.

- **If less than 1 Ω**

6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Front Seat Belt Buckle Replacement
- Control Module References for Inflatable Restraint Sensing and Diagnostic Module and Instrument Cluster replacement, programming and setup

SEAT BELT INDICATOR MALFUNCTION - PASSENGER

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC B059A 01

Passenger Seat Belt Indicator Circuit Short to Battery

DTC B059A 02

Passenger Seat Belt Indicator Circuit Short to Ground

DTC B059A 04

Passenger Seat Belt Indicator Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Seat Belt Indicator Control	B059A 02	B059A 04	B059A 01	-

Circuit/System Description

The Inflatable Restraint Sensing and Diagnostic Module (SDM) monitors the passenger seat status and the passenger seat belt buckle switch and provides an output to the passenger seat belt indicator. When the Inflatable Restraint Sensing and Diagnostic Module detects the passenger seat is occupied and the seat belt is not fastened, the Inflatable Restraint Sensing and Diagnostic Module supplies a pulse width modulated signal to control the passenger seat belt indicator circuit. The Inflatable Restraint Sensing and Diagnostic Module monitors the passenger seat belt indicator circuits and if a fault is detected a DTC will be set.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B059A 01

The passenger seat belt indicator circuit is shorted to voltage.

B059A 02

The passenger seat belt indicator circuit is shorted to ground.

B059A 04

The passenger seat belt indicator circuit is open.

Action Taken When the DTC Sets

The Inflatable Restraint Sensing and Diagnostic Module will store the DTC.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **S48B Multifunction Switch - Overhead Console.**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Ignition OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

- **If 10 Ω or greater**

1. Ignition OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Connect a test lamp between the control circuit terminal 13 and ground, ignition ON.
4. Verify the test lamp turns OFF and ON when the passenger seat belt is buckled and unbuckled with occupant in seat.

- **If the test lamp is always on**

1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If the test lamp is always off**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Test for infinite resistance between the seat belt switch signal circuit terminal 45 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
- **If test lamp turns on and off while changing between the commanded states**
5. Test or replace the S48B Multifunction Switch - Overhead Console.

SEAT BELT INDICATOR MALFUNCTION - REAR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Rear Seat Belt Switch Signal	1	2	2	2	-
Rear Seat Belt Switch Low Reference	-	2	2	2	-
1. Green indicator will illuminate only for the bulb check. The red indicator will remain ON with seat belt buckled.					
2. Green indicator will illuminate only for the bulb check. The red indicator will never illuminate.					

Circuit/System Description

The two rear seat belt switches are 2-wire switch wired to the Inflatable Restraint Sensing and Diagnostic Module using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The Inflatable Restraint Sensing and Diagnostic Module sends the status of the rear seat belt via serial data to the driver information center (DIC). After receiving the message, the driver information center controls the illumination of the rear seat belt indicators.

Second row seating positions monitored for safety belt use are represented by a colored symbol on the

instrument cluster indicating safety belt status.

When the vehicle is started, two safety belt symbols come on and stay on for several seconds to alert the driver that passengers may need to fasten their safety belts. After the passenger safety belt is buckled, the corresponding safety belt symbol in the instrument cluster turns green. If a safety belt is not initially buckled, the instrument cluster displays a gray safety belt symbol.

While the vehicle is moving, if a second row passenger who was previously buckled becomes unbuckled, the corresponding safety belt symbol will change to flashing red for several seconds and a chime may sound.

Diagnostic Aids

- The mechanical stop in the buckle may prevent latching but the switch in the buckle may momentarily open and the Inflatable Restraint Sensing and Diagnostic Module would interpret this as an occupant in the rear seat position and that the buckle was attempting to latch.
- If a rear occupant attempts to latch the seat belt into the wrong buckle, the indicator may illuminate and the system assumes there is an occupant not buckled in that seat position.
- An unseated connector can appear as a buckled seat belt connection.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that all connectors are fully seated.
2. With a scan tool, monitor the appropriate 2nd Row Seat Belt Status parameter and P16 Instrument Cluster rear seat belt indicator while buckling and unbuckling the seat belt. The parameter should display Buckled when the rear seat belt is buckled and Unbuckled when the rear seat belt is unbuckled.

- If the scan tool does not display the parameters as specified, refer to Circuit System Testing.
- If the scan tool displays the parameters as specified but the P16 Instrument Cluster does not display the correct corresponding rear seat belt indicator, replace the P16 Instrument Cluster.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **B153 Seat Belt Buckle**
- **B153 Seat Belt Buckle harness connector**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

1. Vehicle OFF.
2. Disconnect the harness connector at the appropriate B153 Seat Belt Buckle.
3. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
 - **If 5 Ω or greater**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 5 Ω**
4. Vehicle in Service Mode.
5. Verify the scan tool 2nd Row Seat Belt Status parameter displays Buckled.
 - **If the scan tool 2nd Row Seat Belt Status parameter does not display Buckled**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the seat belt switch signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If the scan tool 2nd Row Seat Belt Status parameter does display Buckled**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
7. Verify the scan tool 2nd Row Seat Belt Status parameter displays Unbuckled.
 - **If the scan tool 2nd Row Seat Belt Status parameter does not display Unbuckled**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Vehicle in Service Mode.
 3. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

4. Test for less than 2 Ω in each circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

• **If the scan tool 2nd Row Seat Belt Status parameter does display Unbuckled**

8. Replace the B153 Seat Belt Buckle.

Component Testing

1. Vehicle OFF.

2. Disconnect the harness connector at the appropriate B153 Seat Belt Buckle.

3. Buckle the B153 Seat Belt Buckle.

4. Test for infinite resistance between the signal circuit terminal 1 and the low reference terminal 2 at the B153 Seat Belt Buckle.

- **If there is not infinite resistance**

Replace the B153 Seat Belt Buckle.

- **If there is infinite resistance**

5. Unbuckle the B153 Seat Belt Buckle.

6. Test for less than 1 Ω between the signal circuit terminal 1 and the low reference terminal 2 at the B153 Seat Belt Buckle.

- **If 1 Ω or greater**

Replace the B153 Seat Belt Buckle.

- **If less than 1 Ω**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Rear Seat Belt Buckle Replacement**
- **Control Module References** for Inflatable Restraint Sensing and Diagnostic Module and instrument cluster replacement, programming and setup

SEAT BELT SERVICE PRECAUTIONS

IMPORTANT: If the vehicle has been in a collision, refer to **Repairs and Inspections Required After a Collision** for additional information.

- Do not bleach or dye the seat belt webbing. Use only the following items in order to clean the seat belt webbing:
 - A mild soap and water solution
 - A soft brush or cloth
- Keep sharp edges and damaging objects away from the seat belts. Avoid bending or damaging any part of

the seat belt buckle or the latch plate. Replace any seat belts which are cut or damaged in any way.

- Use only the correct seat belt anchor bolts/screws and tighten the anchor bolts/screws to the correct torque value. Refer to [Fastener Specifications](#). When installing seat belt anchor bolts, start the bolt by hand to ensure that the bolt is threaded straight.
- Some seat belts and retractors require service as a set, with service replacement parts only. Do not attempt to repair to individual components that require service as a set.
- Verify that the replacement part number is correct for the vehicle at that seating position. Do not substitute a seat belt from a different seating position.

REPAIR INSTRUCTIONS

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

WARNING: Restraint systems can be damaged in a collision. To help avoid injury and ensure that all parts in need of replacement are replaced:

- Replace any seat belt system that was in use during the collision serious enough to deploy any automatic restraint device such as air bags and seat belt pretensioners. This not only includes seat belt systems in use by people of adult size, but seat belt systems used to secure child restraints, infant carriers and booster seats, including LATCH system and top tether anchorages.
- Replace any seat belt system that has torn, worn, or damaged components. This not only includes adult seat belt systems, but built-in child restraints and LATCH system components, if any.
- Replace any seat belt system if you observe the words "REPLACE" or "CAUTION", or if a yellow tag is visible. Do not replace a seat belt if only the child seat caution label is visible.
- Replace any seat belt system if you are doubtful about its condition. This not only includes adult seat belt systems, but built-in child restraints, LATCH system components, and any restraint system used to secure infant carriers, child restraints, and booster seats.

Do NOT replace single seat belt system components in vehicles that have been in a collision as described above. Always replace the entire seat belt system with the buckle, guide and retractor assembly, which includes the latch and webbing material.

After a minor collision where no automatic restraint device was deployed, seat belt system replacement may not be necessary, unless some of the parts are torn, worn, or damaged.

SEAT BELT LATCH STOP INSTALLATION

Fig. 3: View Of Seat Belt Latch Stop Components

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
1. Locate the hole in the seat belt webbing where the original seat belt stop button was located. 2. If the original hole in the seat belt webbing is not visible, perform the following: • If either the right or left stop button is missing use the opposing seat belt as a reference. • With the opposing seat belt fully stowed, measure the distance between the seat belt lower anchor and the stop button. • Using the measurement obtained above, measure and mark the location of the missing stop button on the center of the seat belt webbing. 3. Ensure the seat belt latch plate is located above the mark or original hole.	

Callout	Component Name
1	Seat Belt Stop Button Procedure 1. Work the male half of the stop button through the hole in the webbing or at the marked location. 2. Align the female half of the stop button with the male half of the stop button. 3. Snap the two halves together. 4. Trim off any excess of the male half of the stop button flush with the female half of the stop button. TIP: Ensure the male half of the stop button is facing forward in the vehicle in order to ensure the stop button will not snag customers clothing.

FRONT SEAT BELT BUCKLE REPLACEMENT

Restraint System

NOTE: If the vehicle has been in a collision, refer to [Repairs and Inspections Required](#)

After a Collision for additional information.

The vehicle has front and rear seat belts that are the primary means of occupant restraint. Seat belts help to keep the occupants inside the passenger compartment and to gradually reduce the impact forces during the following events:

- Frontal impact type crashes
- Rear impact type crashes
- Side impact type crashes
- Roll-over type crashes

All seat belt retractors have emergency locks. The retractors remain unlocked during normal operation and under normal driving conditions. The retractors remain unlocked during normal conditions in order to allow free movement of the upper body of each occupant. A pendulum locks the seat belt webbing into position. The pendulum causes a locking bar to engage a cog on the spool of the retractor mechanism when the following conditions occur:

- A rapid extraction of the seat belt webbing from the retractor
- An abrupt change in vehicle speed
- An abrupt change in vehicle direction
- Operation of the vehicle on a steep upgrade
- Operation of the vehicle on a downgrade

The seat belts have an automatic locking (cinch) feature. The cinch feature is activated when the seat belt webbing is completely extended from the retractor. The cinch feature prevents the webbing from extending beyond the position from which it is allowed to retract. Use of the cinch feature is recommended for securing a child seat. The cinch feature may be cancelled by allowing the webbing to wind back completely into the retractor. After the cinch feature is cancelled, the webbing is unlocked. After the cinch feature is cancelled, the webbing will extend from the retractor. This vehicle is also equipped with a supplemental inflatable restraint (SIR) system. Refer to **Supplemental Inflatable Restraint System Description and Operation** .

Front Seat Belt System

The front seat belt system includes a driver and passenger seat belt pretensioner retractor and anchor. Both front seat belt pretensioners includes a seat belt switch in the seat buckle which controls a reminder lamp and a tone alarm.

NOTE: **The front passenger seat is equipped with a passenger presence detection sensor, which detects an occupant. If the passenger presence detection sensor detects an empty front passenger seat, then the passenger fasten safety belt indicator will be disabled.**

- When the driver seat belt is buckled and the vehicle mode switch is in Vehicle ON mode, the following events will occur:
 - The tone alarm will not operate.
 - The reminder lamp will not operate.
- When the passenger seat belt is buckled with an occupant sitting in the passenger front seat, Vehicle ON,

the following events will occur:

- The tone alarm will not operate.
- The reminder lamp, which is located within the Passenger Air Bag Disable Indicator, will not be turned ON.
- When the driver seat belt is not buckled and Vehicle ON, the following events will occur:
 - The tone alarm will operate for 4 - 8 seconds and then go OFF.
 - The fasten safety belt indicator will turn ON for 20 seconds, until the driver seat belt is buckled.
- When the passenger seat belt is not buckled with an occupant sitting in the passenger front seat, then the Vehicle ON, the following events will occur:
 - The tone alarm will operate for 4 - 8 seconds and then go OFF.
 - The reminder lamp, which is located within the Passenger Air Bag Disable Indicator, will be turned ON.

Rear Seat Belt System

The Rear Seat Belt System includes the following components:

- The rear seat belt retractor is located at the wheelhouse panel and attached to the floor panel by the rear seat shoulder belt retractor bracket.
- The rear seat belt buckles are attached to each seat.
- Each of the rear seat belts include a seat belt switch in the seat buckle which controls a reminder lamp and a tone alarm.
- If both rear seat belts are unbuckled when the vehicle is started the rear seat belt indicators show as red indicators in the Driver Information Center.
- If any rear seat belts are buckled when the vehicle is started, the corresponding indicators will be green for that seat.
- When in Vehicle ON mode, a rear seat belt is buckled, the rear doors are closed and the speed exceeds 10 kph (6.5 mph) for a continuous 35 seconds the following events will occur:
 - The tone alarm will not operate.
 - The green rear seat belt indicators in the Driver Information Center will illuminate for 35 seconds.
- When in Vehicle ON mode, a rear seat belt is not buckled for the duration of the ignition cycle, the rear doors are closed and the speed exceeds 10 kph (6.5 mph) for a continuous 35 seconds the following events will occur:
 - The tone alarm will not operate.
 - The red rear seat belt indicator in the Driver Information Center will remain illuminated.
- When in Vehicle ON mode, a rear seat belt is buckled and during that ignition cycle is unbuckled with the rear doors closed at all times and the speed exceeding 10 kph (6.5 mph) for a continuous 35 seconds the following events will occur:
 - The tone alarm will operate for 3 seconds.
 - The red rear seat belt indicator in the Driver Information Center will illuminate and remain on for a continuous 35 seconds until the seat belt is buckled again or the ignition cycle ends.

Child Seat Restraint System

WARNING: A child in a rear-facing child restraint can be seriously injured if the right-front

A child in a rear-facing child restraint can be seriously injured if the right-front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored. Passengers should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

All vehicles are equipped with a dual-mode type retractor with emergency and automatic locking features. The automatic locking feature is for restraint of a child seat. The child seat can be secured by pulling the seat belt all the way out to lock it. Then tighten the seat belt around the child seat.

If a child seat is to be used in the second seat position, a special dealer-installed anchor must be used in order to anchor the child seat top strap. This only applies to the seats designed with the top strap provision and for the vehicles sold in Canada. In order to ensure the correct top strap angle, the child seat is only to be used at the seating position for which the top strap anchor is installed.

Fasten Safety Belt Indicators

There are three fasten safety belt indicators for this vehicle. The driver fasten safety belt reminder is displayed in the Instrument Cluster, the passenger fasten safety belt reminder is displayed in the passenger air bag disable indicator, and the rear fasten safety belt reminder is displayed in the driver information center. The fasten safety belt indicator may only be ON during RUN. The fasten safety belt indicator illuminates under the following conditions:

- During the bulb check
 - The Inflatable Restraint Sensing and Diagnostic Module (SDM) sends the status of the driver seat belt to the instrument cluster via serial data. The passenger seat belt status is sent to the passenger air bag disable indicator via serial data. The rear seat belt status is sent to the driver information center via serial data. If any of the seat belts are unfastened, the instrument cluster will send a message requesting a chime sound to be turned ON after a bulb check.

Circuit/System Description

During a frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy the steering wheel air bag. The SDM performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. There are two shorting bars used within the steering wheel air bag coil connector which will short together both steering wheel air bag stage 1 high control circuit and steering wheel air bag stage 1 low control circuit and both steering wheel air bag stage 2 high control circuit and steering wheel air bag stage 2 low control circuit when the connector is disconnected. This will help to prevent unwanted deployment of the steering wheel air bag during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0012 01 stage 1 or B0013 01 stage 2

The steering wheel air bag deployment loop is shorted to voltage for 2 s

B0012 02 stage 1 or B0013 02 stage 2

The steering wheel air bag deployment loop is shorted to ground for 2 s

B0012 04 stage 1 or B0013 04 stage 2

The steering wheel air bag deployment loop is open for 2 s

B0012 0D stage 1 or B0013 0D stage 2

The steering wheel air bag deployment loop resistance is greater than 4.4 Ω for 2 s

B0012 0E stage 1 or B0013 0E stage 2

The steering wheel air bag deployment loop resistance is less than 1.7 Ω for 2 s

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployment.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

A worn steering wheel air bag coil can cause a repeated history DTC to set. To verify this condition, turn the steering wheel 360 degrees in one direction then back 360 degrees in the other direction, multiple times, while viewing the scan tool Deployment Loop Resistance parameters.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Steering wheel air bag assembly
- Steering wheel air bag coil assembly
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Circuit/System Verification

NOTE:

- Refer to SIR Service Precautions.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Driver steering wheel air bag
 - Driver steering wheel air bag coil
 - Inflatable restraint sensing and diagnostic module
 - Air bag wiring harness connector
 - Inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace

any CPA that is damaged or missing.

- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any spikes or dropouts while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.

- **If less than 2.1 Ω or greater than 4.0 Ω**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts**

Replace the X85 Steering Wheel Air Bag Coil.

- **If between 2.1 - 4.0 Ω without any spikes or dropouts**

2. Verify DTC B0012 or B0013 is only set as a history DTC.

- **If the DTC is set as current**

Refer to Circuit/System Testing.

- **If the DTC is set as history**

3. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any drop outs or spikes while moving the harness near each connector listed below.

- X85 Steering Wheel Air Bag Coil
- F107 Steering Wheel Air Bag
- Any inline harness connector
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If the reading is erratic while moving the harness, perform the following**
- Inspect each connector terminal for damage or corrosion and repair as necessary
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
- Ensure each connector and CPA is correctly seated
- **If between 2.1 - 4.0 Ω without any spikes or dropouts**

4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the scan tool and disconnect the appropriate harness connector listed below at the F107 Driver Steering Wheel Air Bag.

- DTC B0012 connector X1
- DTC B0013 connector X2

2. Test for greater than 25 Ω between the control circuit terminal 1 and the control circuit terminal 2.

- **If 25 Ω or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.

- If less than infinite resistance, repair the short between the two circuits.
- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

3. Ignition ON.

4. Test for less than 11 V between each control circuit terminal listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 11 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. Ignition OFF.

6. Test for greater than 25 Ω between each control circuit terminal listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 25 Ω or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow

accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

• If greater than 25 Ω

7. Install a 3 A fused jumper wire between the control circuit terminal 1 and the control circuit terminal 2, ignition ON.

8. Verify the appropriate scan tool Deployment Loop Resistance parameter is consistently less than 2 Ω while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.

• If the reading is erratic while turning the steering wheel

Replace the X85 Steering Wheel Air Bag Coil.

• If 2 Ω or greater

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for less than 2 Ω in the K85 Steering Wheel Airbag Coil and each control circuit end to end.

- If 2 Ω or greater, replace the X85 Steering Wheel Air Bag Coil or repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

• If less than 2 Ω

9. Ignition OFF, connect the harness connector at the F107 Steering Wheel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.

10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

11. Verify DTC B0012 or B0013 is not set.

• If DTC B0012 or B0013 is set

Test or replace the F107 Steering Wheel Air Bag.

• If DTC B0012 or B0013 is not set

12. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force, the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short the control circuits together when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0014 01, B0021 01, B0031 01, B0038 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0014 02, B0021 02, B0031 02, B0038 02

The air bag control circuit is shorted to ground for 2 seconds.

B0014 04, B0021 04, B0031 04, B0038 04

The air bag control circuit is open for 2 seconds.

B0014 0D, B0021 0D, B0031 0D, B0038 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0014 0E, B0021 0E, B0031 0E, B0038 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Front and rear seat side air bags
- Left and right roof rail air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE:

- Refer to [SIR Service Precautions](#).
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Seat side air bag
 - Inflatable restraint sensing and diagnostic module
 - All wiring harness connectors
 - Inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any spikes or dropouts while moving the harness near each connector.

- F106 Seat Side Air Bag
- Any inline harness connector
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If less than 2.1 Ω or greater than 4.0 Ω**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following:**
 - Inspect each connector terminal and harness for damage or corrosion and repair as necessary.
 - Apply dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal.
 - Ensure each connector and CPA is correctly seated.
 - **If between 2.1 - 4.0 Ω without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, disconnect the harness connector at the appropriate F106 Seat Side Air Bag.

2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.

- **If 25 Ω or less**

1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the 2 control circuits.

- If less than infinite resistance, repair the short between the 2 circuits.
- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

3. Ignition ON.

4. Test for less than 11 V between each control circuit terminal listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 11 V or greater**

1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. Ignition OFF.

6. Test for greater than 25 Ω between each control circuit terminal listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 25 Ω or less**

1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

7. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2, ignition ON.

8. Verify the appropriate scan tool Deployment Loop Resistance parameter is less than 2 Ω .

- **If 2 Ω or greater**

1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 2 Ω**

9. Ignition OFF, connect the harness connector at the F106 Seat Side Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.

10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

11. Verify DTC B0014, B0021, B0031, or B0038 is not set.

- **If DTC B0014, B0021, B0031, or B0038 is set**

Test or replace the F106 Seat Side Air Bag.

- **If DTC B0014, B0021, B0031, or B0038 is not set**

12. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0015 01, B001A 01, B001B 01, B0022 01

The pretensioner control circuit is shorted to voltage for 2 seconds.

B0015 02, B001A 02, B001B 02, B0022 02

The pretensioner control circuit is shorted to ground for 2 seconds.

B0015 04, B001A 04, B001B 04, B0022 04

The pretensioner control circuit is open for 2 seconds.

B0015 0D, B001A 0D, B001B 0D, B0022 0D

The pretensioner deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0015 0E, B001A 0E, B001B 0E, B0022 0E

The pretensioner deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the Instrument Cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger anchor or retractor pretensioners
- Inline connectors - on the side of the harness connector
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop

parameters.

Circuit/System Verification

NOTE:

- Refer to **SIR Service Precautions**.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Seat belt retractor pretensioner
 - Seat belt retractor pretensioner wiring harness connector
 - Seat belt anchor pretensioner
 - Seat belt anchor pretensioner wiring harness connector
 - Inflatable Restraint Sensing and Diagnostic Module
 - Inflatable Restraint Sensing and Diagnostic Module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:

- F112 Seat Belt Retractor Pretensioner
- F113 Seat Belt Anchor Pretensioner
- Any inline harness
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If less than 2.1 or greater than 4.0 Ω**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
- Inspect each connector terminal and harness for damage or corrosion and repair as necessary.
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal.
- Ensure each connector and CPA is correctly seated.
- **If within 2.1 and 4.0 Ω without any spikes or dropouts**

2. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the scan tool. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the appropriate harness connector listed below:

- F112 Seat Belt Retractor Pretensioner
- F113 Seat Belt Anchor Pretensioner

2. Test for greater than 25 Ω between the appropriate control circuit terminals listed below:

- F112 Seat Belt Retractor Pretensioner terminals 1 and 2
- F113 Seat Belt Anchor Pretensioner terminals 1 and 2
- **If 25 Ω or less**

1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE:

Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the 2 control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 Ω**
3. Vehicle in Service Mode.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
 - F112 Seat Belt Retractor Pretensioner terminal 1
 - F112 Seat Belt Retractor Pretensioner terminal 2
 - F113 Seat Belt Anchor Pretensioner terminal 1
 - F113 Seat Belt Anchor Pretensioner terminal 2
 - **If 11 V or greater**
 1. Vehicle OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, vehicle in Service Mode.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 11 V**
5. Vehicle OFF. It may take up to 2 minutes for all vehicle systems to power down.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
 - F112 Seat Belt Retractor Pretensioner terminal 1
 - F112 Seat Belt Retractor Pretensioner terminal 2
 - F113 Seat Belt Anchor Pretensioner terminal 1
 - F113 Seat Belt Anchor Pretensioner terminal 2
 - **If 25 Ω or less**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 Ω**
7. Install a 3 A fused jumper wire between the appropriate control circuit terminals listed below:
 - F112 Seat Belt Retractor Pretensioner terminals 1 and 2
 - F113 Seat Belt Anchor Pretensioner terminals 1 and 2
8. Vehicle in Service Mode.
9. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .
 - **If 2 Ω or greater**
 1. Vehicle OFF.
 2. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 3. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 2 Ω**

10. Vehicle OFF, connect the harness connector at the F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner, press in the CPA (if equipped) until an audible and/or tactile click is heard.
11. Vehicle in Service Mode, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B0015, B001A, B001B, or B0022 is not set.

- **If B0015, B001A, B001B, or B0022 is set**

Replace the appropriate F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner.

- **If DTC B0015, B001A, B001B, or B0022 is not set**

13. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0016 01, B0023 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0016 02, B0023 02

The air bag control circuit is shorted to ground for 2 seconds.

B0016 04, B0023 04

The air bag control circuit is open for 2 seconds.

B0016 0D, B0023 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0016 0E, B0023 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Left and right roof rail air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat DTC can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

[Circuit/System Verification](#)

NOTE:

- Refer to [SIR Service Precautions](#).
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Roof rail air bag
 - Roof rail air bag wiring harness connector
 - Inflatable restraint sensing and diagnostic module
 - Inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the appropriate scan tool Deployment Loop Resistance parameter stays consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:

- F105L Roof Rail Air Bag - Left
- F105R Roof Rail Air Bag - Right
- Any inline harness connector
- K36 inflatable restraint sensing and diagnostic module
- **If less than 2.1 or greater than 4.0 Ω**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Ensure each connector and CPA is correctly seated.
- **If within 2.1 and 4.0 Ω without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Ignition OFF. Scan tool disconnected. Disconnect the harness connector at the appropriate F105 Roof Rail Air Bag. It may take up to 2 min for all vehicle systems to power down.

2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.

- **If 25 Ω or less**

1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.

- If less than infinite resistance, repair the short between the two circuits.
- If infinite resistance, replace the K36 inflatable restraint sensing and diagnostic module.

- **If greater than 25 Ω**

3. Ignition ON.

4. Test for less than 11 V between the control circuit terminals listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2
- **If 11 V or greater**

1. Ignition OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and

diagnostic module. Ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 inflatable restraint sensing and diagnostic module.

- **If less than 11 V**

5. Ignition OFF.

6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 25 Ω or less**

1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K36 inflatable restraint sensing and diagnostic module.

- **If greater than 25 Ω**

7. Ignition OFF. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2. Ignition ON.

8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

- **If 2 Ω or greater**

1. Ignition OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.

2. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 inflatable restraint sensing and diagnostic module.

- **If less than 2 Ω**

9. Ignition OFF, connect the harness connector at the F105 Roof Rail Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.

10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

11. Verify DTC B0016 or B0023 is not set.

- **If DTC B0016 or B0023 is set**

Test or replace the F105 Roof Rail Air Bag.

- **If DTC B0016 or B0023 is not set**

12. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short together the control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0017 01, B0024 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0017 02, B0024 02

The air bag control circuit is shorted to ground for 2 seconds.

B0017 04, B0024 04

The air bag control circuit is open for 2 seconds.

B0017 0D, B0024 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0017 0E, B0024 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the

system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger Knee Air Bags
- Inline connectors - on the side of the harness connector
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop parameters.

Control Module References for scan tool information

Circuit/System Verification

NOTE:

- Refer to [SIR Service Precautions](#).
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Knee Air Bag
 - Inflatable Restraint Sensing and Diagnostic Module
 - Knee Air Bag wiring harness connector
 - Inflatable Restraint Sensing and Diagnostic Module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:

- F114D Knee Air Bag - Driver
- F114P Knee Air Bag - Passenger
- Any inline harness
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If less than 2.1 or greater than 4.0 Ω**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
- Insure each connector and CPA is correctly seated.
- **If within 2.1 and 4.0 Ω without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Vehicle OFF, disconnect the scan tool, disconnect the appropriate F114 Knee Air Bag harness connector, and then wait for 120 seconds.
2. Test for greater than 25 Ω between the appropriate control circuit terminals 1 and 2.

- **If 25 Ω or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

3. Vehicle in Service Mode.

4. Test for less than 11 V between the control circuit terminals listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 11 V or greater**

1. Vehicle OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, Vehicle in Service Mode.

2. Test for less than 1 V between each control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. Vehicle OFF.

6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 25 Ω or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between each control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

7. Vehicle OFF, install a 3 A fused jumper wire between the control circuit terminals 1 and 2.

8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

- **If 2 Ω or greater**

1. Vehicle OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 2 Ω**

9. Vehicle OFF, connect the harness connector at the F114 knee air bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.

10. Vehicle in Service Mode, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

11. Verify DTC B0017 or B0024 is not set.

- **If DTC B0017 or B0024 is set**

Replace the appropriate F114 Knee Air Bag.

- **If DTC B0017 or B0024 is not set**

12. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short the control circuits together when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0019 01, B0020 01

The air bag control circuit is shorted to voltage for 2 s.

B0019 02, B0020 02

The air bag control circuit is shorted to ground for 2 s.

B0019 04, B0020 04

The air bag control circuit is open for 2 s.

B0019 0D, B0020 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 s.

B0019 0E, B0020 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 s.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Passenger instrument panel air bag
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Special Tools

EL-38125-580 Terminal Release Tool Kit

Circuit/System Verification

NOTE:

- Refer to **SIR Service Precautions.**
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Passenger instrument panel air bag
 - inflatable restraint sensing and diagnostic module
 - Passenger instrument panel air bag wiring harness connector
 - inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:

- F101 Passenger Instrument Panel Air Bag
- Any inline harness connector
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If less than 2.1 Ω or greater than 4.0 Ω**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
- Insure each connector and CPA is correctly seated.
- **If between 2.1 - 4.0 Ω without any spikes or dropouts**

2. All OK.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, disconnect the X302 inline harness connector for the F101 Passenger Instrument Panel Air Bag. It may take up to 2 min for all vehicle systems to power down.
2. Test for greater than 25 Ω between the appropriate control circuit terminals listed below on the K36 Inflatable Restraint Sensing and Diagnostic Module side of the connector:
 - F101 Passenger Instrument Panel Air Bag stage 1 X302 terminal 1 and 2
 - F101 Passenger Instrument Panel Air Bag stage 2 X302 terminal 3 and 4
 - **If 25 Ω or less**
 1. Disconnect the X1 harness connector at the K36 inflatable restraint sensing and diagnostic module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between each control circuit terminal listed below on the instrument panel harness side of the connector and ground:
 - X302 control circuit terminal 1
 - X302 control circuit terminal 2
 - X302 control circuit terminal 3
 - X302 control circuit terminal 4
 - **If 11 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between each control circuit terminal listed below on the instrument panel harness side of the connector and ground:
 - X302 control circuit terminal 1

- X302 control circuit terminal 2
- X302 control circuit terminal 3
- X302 control circuit terminal 4
- **If 25 Ω or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 Ω**

7. Install a 3 A fused jumper wire between the control circuit terminals listed below on the instrument panel harness side of the connector:

- F101 Passenger Instrument Panel Air Bag stage 1 X302 terminal 1 and 2
- F101 Passenger Instrument Panel Air Bag stage 2 X302 terminal 3 and 4

8. Ignition ON.

9. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

- **If 2 Ω or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 2 Ω**

10. Ignition OFF, connect the X302 inline harness connector and disconnect the appropriate X1 (DTC B0019) or X2 (DTC B0020) harness connector at the F101 Passenger instrument panel air bag, ignition ON.

11. Test for less than 11 V between each control circuit terminals listed below and ground:

- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X2
- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
- **If 11 V or greater**

Repair the short to voltage on the circuit.

- **If less than 11 V**

12. Ignition OFF.

13. Test for greater than 25 Ω between each control circuit terminals listed below and ground:

- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X2

- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
- **If 25 Ω or less**

Repair the short to ground on the circuit.

- **If greater than 25 Ω**

14. Install a 3 A fused jumper wire between the control circuit terminals listed below:

- F101 Passenger Instrument Panel Air Bag stage 1 control circuit terminal 1 X1 and 2 X1
- F101 Passenger Instrument Panel Air Bag stage 2 control circuit terminal 1 X2 and 2 X2

15. Ignition ON.

16. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

- **If 2 Ω or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit between the F101 Passenger Instrument Panel Air Bag connector and the X302 inline harness connector.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 2 Ω**

17. Ignition OFF, connect the harness connector at the F101 Passenger Instrument Panel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.

18. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

19. Verify DTC B0019 or B0020 is not set.

- **If DTC B0019 or B0020 is set**

Test or replace the F101 Passenger Instrument Panel Air Bag.

- **If DTC B0019 or B0020 is not set**

20. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Panel Airbag Replacement**
- **SIR/SRS Wiring Repairs**
- **Control Module References** for inflatable restraint sensing and diagnostic module control module replacement, programming and setup

DTC B0052: DEPLOYMENT COMMANDED CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using the diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B0052 00

Deployment Commanded

DTC B0052 56

Deployment Commanded Too Many Transitions

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) senses vehicle impacts and provides deployment signals to the air bags and anchor and/or retractor pretensioners when warranted. The inflatable restraint sensing and diagnostic module sets DTC B0052 after each command for deployment. DTC B0052 will latch and not clear after 3 commanded deployments by the inflatable restraint sensing and diagnostic module. Therefore the inflatable restraint sensing and diagnostic module has to be replaced.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

- The inflatable restraint sensing and diagnostic module detects a frontal impact of sufficient force to warrant deployment of the frontal air bags.
- The inflatable restraint sensing and diagnostic module detects a side impact or rollover (if equipped) of sufficient force to warrant deployment of a seat air bag and/or roof rail air bag.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- DTC B0052 00 is a DTC that may be cleared with a scan tool without replacing the inflatable restraint sensing and diagnostic module. This DTC will not clear if deployment has been commanded more than two times, and the inflatable restraint sensing and diagnostic module would have to be replaced.
- DTC B0052 56 is a latched DTC. The DTC cannot be cleared with the scan tool. Replacement of the inflatable restraint sensing and diagnostic module is required.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that DTC B0052 00 is not set.

- **If DTC B0052 00 is set**

Clear the DTC. If the DTC will not clear, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If DTC B0052 00 is not set**

2. Verify that DTC B0052 56 is not set.

- **If DTC B0052 56 is set**

Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If DTC B0052 56 is not set**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for inflatable restraint sensing and diagnostic module replacement, programming and setup

DTC B0074: PASSENGER PRESENCE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0074 00

Passenger Presence Sensor Circuit Malfunction

DTC B0074 0D

Passenger Presence Sensor Resistance Above Threshold

DTC B0074 0E

Passenger Presence Sensor Resistance Below Threshold

DTC B0074 0F

Passenger Presence Sensor Erratic (Wet Seat)

Circuit/System Description

The passenger presence module monitors the sensor status continually. Whenever the sensor mat has an internal malfunction, the passenger presence module will set DTC B0074.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0074 00

The passenger presence module has detected a disconnection from the sensor mat.

B0074 0D

The passenger presence module has detected a resistance above threshold.

B0074 0E

The passenger presence module has detected a resistance below threshold.

B0074 0F

The passenger presence module has detected a wet seat fault.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument panel cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the inflatable restraint sensing and diagnostic module or passenger presence module were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (computers, MP3 players, cell phones, diagnostic scan tool, power inverter, etc.) was placed on the passenger seat the passenger presence module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Supplemental Inflatable Restraint System Description and Operation

Electrical Information Reference

- Circuit Testing
- Testing for Intermittent Conditions and Poor Connections
- Connector Repairs
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: This system is serviced as a kit (seat foam, module and/or sensing mat). Perform a Passenger Presence System Preload whenever a component is replaced, refer to Passenger Presence System Programming and Setup . Inspect component connectors for damage or corrosion. Repair or replace the affected component/connector:

- Passenger presence module

- Passenger presence module harness connector
- Seat wiring harness to vehicle harness connector

The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click.

1. Verify the DTC remains current while moving the passenger seat forward and backward through it's full range of motion.

- **If the DTC changes to History**

If the status changes this could be indication of a seat to vehicle harness connection issue, refer to Circuit/System Testing.

- **If the DTC remains Current**

2. Verify with the scan tool, the fault does not change status while moving the harness near each connector listed below.

- K85 Passenger Presence Module
- B60 Passenger Presence Sensor
- Any seat harness inline

- **If the status changes**

If the reading is erratic while moving the harness, perform the following:

- Inspect each connector terminal for damage or corrosion and repair as necessary.
- Ensure each connector and CPA is correctly seated.

- **If the status does not change**

3. All OK.

Circuit/System Testing

NOTE: This system is serviced as a kit (seat foam, module and/or sensing mat). Perform a Passenger Presence System Preload whenever a component is replaced, refer to [Passenger Presence System Programming and Setup](#) . Inspect component connectors for damage or corrosion. Repair or replace the affected component/connector:

1. Confirm that all passenger presence system connectors are fully seated.

2. Verify that DTC B0074 0F is not set.

- **DTC B0074 0F is set.**

NOTE: Verify there are no electronic devices on the passenger seat. If not, then verify the seat is dry by removing the trim from the seat bottom frame. If the seat is wet, allow 24-48 hours dry time with trim completely off. If the DTC is history, do not replace B60 Passenger Presence Sensor. Clear passenger presence module DTCs.

1. Verify there are no electronic devices on the passenger seat.
 - Completely empty the passenger seat of any objects
 - If the seat is empty
2. Verify the seat is dry by removing the trim from the seat bottom frame.
 - If the seat is wet, allow 24-48 hours dry time with trim completely off.
 - If the seat is dry
3. If the DTC is history, do not replace B60 Passenger Presence Sensor, and clear passenger presence module DTCs.
 - **DTC B0074 0F does not set.**
3. Verify DTC B0074 00, B0074 0D or B0074 0E is not set.
 - **DTC B0074 00, B0074 0D or B0074 0E is set.**

Replace the K85 Passenger Presence Module.

 - **DTC B0074 00, B0074 0D or B0074 0E do not set.**
4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for passenger presence module replacement, programming and setup

DTC B0081: PASSENGER PRESENCE MODULE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using the diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B0081 00

Passenger Presence Module Erratic (sets in the Inflatable Restraint Sensing and Diagnostic Module)

DTC B0081 3A

Passenger Presence Module Incorrect Component Installed (sets in the Inflatable Restraint Sensing and Diagnostic Module)

DTC B0081 71

Passenger Presence Module Invalid Serial Data Received (sets in Inflatable Restraint Sensing and Diagnostic Module)

DTC B0081 11

Passenger Presence Module High Input (sets in the Passenger Presence Module)

DTC B0081 4B

Passenger Presence Module Calibration Not Learned (sets in the Passenger Presence Module)

DTC B0081 5A

Passenger Presence Module Plausibility Failure (sets in Passenger Presence Module)

Circuit/System Description

When the ignition is turned ON, the Passenger Presence Module and the Inflatable Restraint Sensing and Diagnostic Module performs tests to diagnose critical malfunctions. When the Inflatable Restraint Sensing and Diagnostic Module has completed the power-up mode, the Inflatable Restraint Sensing and Diagnostic Module will establish communication with the Passenger Presence Module. The Inflatable Restraint Sensing and Diagnostic Module will also request the instrument panel cluster (IPC) to illuminate both of the PASSENGER AIR BAG ON/OFF indicators ON for 5 seconds. If the Inflatable Restraint Sensing and Diagnostic Module determines the correct Passenger Presence Module is installed and functioning normally, the Inflatable Restraint Sensing and Diagnostic Module will illuminate the passenger air bags ON or OFF indicator based on messages from the Passenger Presence Module. The Inflatable Restraint Sensing and Diagnostic Module sends a message to the IPC to illuminate the appropriate PASSENGER AIR BAG ON/OFF indicator.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

All of the following conditions must exist for 5 seconds:

B0081 00

The Inflatable Restraint Sensing and Diagnostic Module sets this DTC if there is a fault present in the Passenger Presence Module.

B0081 3A

The Inflatable Restraint Sensing and Diagnostic Module sets this DTC when the Inflatable Restraint Sensing and Diagnostic Module has received a message from the Passenger Presence Module which indicates a mismatch between the Inflatable Restraint Sensing and Diagnostic Module and Passenger Presence Module. There is either an incorrect Inflatable Restraint Sensing and Diagnostic Module or Passenger Presence Module installed on this vehicle.

B0081 71

The Inflatable Restraint Sensing and Diagnostic Module sets this DTC when the Inflatable Restraint Sensing and Diagnostic Module has received invalid serial data from the Passenger Presence Module.

B0081 11

The Passenger Presence Module sets this DTC when there is a high input to the Passenger Presence Module.

B0081 4B

The Passenger Presence Module sets this DTC when the Passenger Presence Module has not learned the calibrations.

B0081 5A

The Passenger Presence Module sets this code when the Passenger Presence Module has lost communications with the Inflatable Restraint Sensing and Diagnostic Module.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module disables the passenger instrument panel air bag.
- The Passenger Presence Module will illuminate the Passenger Airbag On/Off indicator status as OFF.
- When the Passenger Presence Module sets this DTC, the Passenger Presence Module communicates with the Inflatable Restraint Sensing and Diagnostic Module to turn the AIRBAG indicator on.
- When the Inflatable Restraint Sensing and Diagnostic Module sets this DTC, the Inflatable Restraint Sensing and Diagnostic Module will turn the AIRBAG indicator on.
- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster (IPC) to illuminate the AIRBAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists and there is no activity on the low speed serial data circuits.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the Inflatable Restraint Sensing and Diagnostic Module or Passenger Presence Module were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (Computers, MP3 Players, Cell Phones, Diagnostic Scan Tool, Power Inverter, etc.) was placed on the passenger seat the Passenger Presence Module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

Circuit/System Verification

NOTE:

- **When removing connectors inspect for damage, corrosion or poor connection. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
- **Passenger Presence Module**
- **Inflatable Restraint Sensing and Diagnostic Module**
- **Passenger Presence Module harness connector**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

1. Vehicle in Service Mode.

Verify that DTC B0081 is the only DTC set in the K36 Inflatable Restraint Sensing and Diagnostic Module or K85 Passenger Presence Module.

- **If any other DTC is set**

Diagnose the other DTCs first, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If B0081 is the only DTC set**

NOTE:

The K36 Inflatable Restraint Sensing and Diagnostic Module sets a redundant B0081 00 DTC when the K85 Passenger Presence Module sets a DTC B0081 11, B0081 4B, or B0081 71.

2. Verify DTC B0081 11 or DTC B0081 4B is not set in the K85 Passenger Presence Module.

- **If DTC B0081 11 or DTC B0081 4B is set in the K85 Passenger Presence Module**

The correct calibration was not learned by the K85 Passenger Presence Module. Perform the Passenger Presence System Preload Test procedure. Refer to [Passenger Presence System Programming and Setup](#) .

- **If neither of these DTCs are set in the K85 Passenger Presence Module**

3. Verify DTC B0081 5A is not set in the K85 Passenger Presence Module.

- **If DTC B0081 5A is set in the K85 Passenger Presence Module**

1. Check the connections at the K36 Inflatable Restraint Sensing and Diagnostic Module and K85 Passenger Presence Module.

2. Clear the DTC's and check if DTC B0081 5A sets again in the K85 Passenger Presence Module.

- If DTC B0081 5A sets again replace the B60 Passenger Presence Sensor.
- If DTC B0081 5A does not set

3. All OK.

- **If none of these DTCs set in the K85 Passenger Presence Module**

4. Verify DTC B0081 3A is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If DTC B0081 3A is set in the K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Either an incorrect replacement K85 Passenger Presence Module or K36 Inflatable Restraint Sensing and Diagnostic Module was placed in this vehicle. Check and make sure the part numbers are correct for each module.

- If either part number is incorrect replace it with the correct part number.
- If both part numbers are correct

2. Clear the DTC's and check if DTC B0081 3A sets again in the K36 Inflatable Restraint Sensing and Diagnostic Module.

- If DTC B0081 3A sets again replace the B60 passenger presence sensor. If the DTC sets again replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
- If DTC B0081 3A does not set

3. All OK.

- **If DTC B0081 3A is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module**

5. Verify DTC B0081 71 is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If DTC B0081 71 is set in the K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Check the connections at the K36 Inflatable Restraint Sensing and Diagnostic Module and K85 Passenger Presence Module.

2. Clear the DTC's and check if DTC B0081 71 sets again in the K36 Inflatable Restraint Sensing and Diagnostic Module.

- If DTC B0081 71 sets again replace the B60 passenger presence sensor.
- If DTC B0081 71 does not set

3. All OK.

- **If DTC B0081 71 does not set in the K36 Inflatable Restraint Sensing and Diagnostic Module**

6. All OK.

DTC Descriptors

DTC B0083

Left Front Impact Sensor

DTC B0084

Right Front Impact Sensor

For symptom byte information refer to [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Front Impact Sensor High Signal	B0083 02	B0083 01, B0083 04,	B0083 05	B0083 3A
Left Front Impact Sensor Low Reference	B0083 02	B0083 01, B0083 04,	B0083 05	B0083 3A
Right Front Impact Sensor High Signal	B0084 02	B0083 01, B0083 04,	B0083 05	B0084 3A
Right Front Impact Sensor Low Reference	B0084 02	B0083 01, B0083 04,	B0083 05	B0084 3A

Circuit/System Description

The impact sensors are equipped on vehicles to supplement the Supplemental Inflatable Restraint (SIR) System performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the inflatable restraint sensing and diagnostic module. The impact sensors can assist in determining the severity of some frontal and side collisions. The inflatable restraint sensing and diagnostic module uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the inflatable restraint sensing and diagnostic module determines a deployment is warranted, the inflatable restraint sensing and diagnostic module will cause current to flow through the deployment loops deploying the air bags.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

Any of the following conditions exist for 10 seconds:

B0083 01, B0084 01

- The sensor circuit is open.
- The sensor circuit has high resistance.

B0083 02, B0084 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 milliseconds.

B0083 04, B0084 04,

- The sensor circuit is open.
- The inflatable restraint sensing and diagnostic module has not received a message from the sensor for greater than 375 milliseconds.

B0083 05, B0084 05

- The sensor has been shorted to voltage.
- The sensor has High Voltage/Open.

B0083 39, B0084 39

- The inflatable restraint sensing and diagnostic module has received a Not OK message from the sensor.
- The inflatable restraint sensing and diagnostic module has not received a message.

B0083 3A, B0084 3A

- The inflatable restraint sensing and diagnostic module has received identification message from the sensor, which does not match the identification stored in the inflatable restraint sensing and diagnostic module memory.
- The inflatable restraint sensing and diagnostic module has reset the impact sensor twice without detecting the correct identification message.

B0083 71, B0084 71

The inflatable restraint sensing and diagnostic module has received invalid serial data from the sensor.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument panel cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

Terminal fretting, damaged terminals, damaged connectors, or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 05 is set.

Control Module References for scan tool information

Circuit/System Verification

NOTE:

- Refer to SIR Service Precautions.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Impact sensor
 - Impact sensor wiring harness connector
 - Inflatable restraint sensing and diagnostic module
 - Inflatable restraint sensing and diagnostic module wiring harness

connector

- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify that DTC B0083 or B0084 symptom byte 39 or 71 is not set as current.

- **If DTC B0083 or B0084 symptom byte 39 or 71 is set as current**

Replace the appropriate B59 Impact Sensor.

- **If DTC B0083 or B0084 symptom byte 39 or 71 is not set as current**

2. Verify that the inflatable restraint sensing and diagnostic module calibrations match the VIN, software part number, and calibration part number.

- **If the inflatable restraint sensing and diagnostic module calibrations do not match the VIN data**

Program the inflatable restraint sensing and diagnostic module.

- **If the inflatable restraint sensing and diagnostic module calibrations match the VIN data**

3. Verify the B59 Front Impact Sensors have the correct part numbers, matching the label part numbers with the parts catalog.

- **If the inflatable restraint sensing and diagnostic module part numbers do not match**

Replace the incorrect B59 Front Impact Sensor

- **If the inflatable restraint sensing and diagnostic module part numbers do match**

4. Verify that DTC B0083 or B0084 symptom byte 01, 02, 04, or 05 is not set as current.

- **If DTC B0083 or B0084 symptom byte 01, 02, 04, or 05 is set as current**

Refer to Circuit/System Testing.

- **If DTC B0083 or B0084 symptom byte 01, 02, 04, 05 is not set as current**

5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate B59 front impact sensor. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Ignition OFF, disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 inflatable restraint sensing and diagnostic module.
- **If less than 10 Ω**
3. Test for greater than 50k Ω between the signal circuit terminal 1 and ground.
 - **If 50k Ω or less**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 50k Ω**
4. Ignition ON, wait 1 min, test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If greater than 1 V, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

5. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V. Ignition ON.
6. Verify the MAX voltage captured by the DMM is between 4 - 9V.
 - **If less than 4 V**
 1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 9V**

1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If between 4 - 9V**
7. Ignition OFF, reconnect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
8. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
9. Operate the vehicle under the conditions for setting the DTC. The DTC should not set.
 - **If the DTC sets**

Replace the B59 Impact Sensor.
 - **If the DTC does not set**
10. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Circuit/System Description

The impact sensors are equipped on vehicles to supplement the supplemental inflatable restraint (SIR) system performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the sensing and diagnostic module (SDM). The impact sensors can assist in determining the severity of some frontal and side collisions. The SDM uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the SDM determines a deployment is warranted, the SDM will cause current to flow through the deployment loops deploying the air bags.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

Any of the following conditions exist for 10 seconds:

B0085 02, B0088 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 milliseconds.

B0085 05, B0088 05

- The sensor circuit is open.
- The inflatable restraint sensing and diagnostic module has not received a message from the sensor for greater than 375 milliseconds.

B0085 39, B0088 39

- The inflatable restraint sensing and diagnostic module has received a Not OK message from the sensor.
- The inflatable restraint sensing and diagnostic module has not received a message.

B0085 3A, B0088 3A

- The inflatable restraint sensing and diagnostic module has received identification message from the sensor, which does not match the identification stored in the inflatable restraint sensing and diagnostic module memory.
- The inflatable restraint sensing and diagnostic module has reset the impact sensor twice without detecting the correct identification message.

B0085 71, B0088 71

The inflatable restraint sensing and diagnostic module has received invalid serial data from the sensor.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument panel cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

Circuit/System Verification

NOTE:

- Refer to **SIR Service Precautions**.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Side impact sensor
 - Inflatable restraint sensing and diagnostic module
 - Front impact sensor wiring harness connector
 - Side impact sensor wiring harness connector
 - Inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify that DTC B0085 or B0088 symptom byte 3A, 39 or 71 is not set as current.

- **If DTC B0085 or B0088 symptom byte 3A, 39 or 71 is set as current**

Replace the appropriate B63 side impact sensor

- **If DTC B0085 or B0088 symptom byte 3A, 39 or 71 is not set as current**
2. Verify that DTC B0085 or B0088 symptom byte 02 or 05 is set as current.
 - **If only DTC B0085 symptom byte 02 or 05 is set as current**
 Refer to Circuit/System Testing - Only DTC B0085 or B0088 is set.
 - **If only DTC B0088 symptom byte 02 or 05 is set as current**
 Refer to Circuit/System Testing - Only DTC B0085 or B0088 is set.
 - **If both DTC B0085 or B0088 symptom byte 02 or 05 is set as current**
 Refer to Circuit/System Testing - Both DTC B0085 and B0088 are set.
 - **If DTC B0085 or B0088 symptom byte 02 or 05 is not set as current**
 3. All OK.

Circuit/System Testing

NOTE: The signal circuit is shared at the K36 inflatable restraint sensing and diagnostic module between the B63LF side impact sensor left front and the B63RR side impact sensor right rear (DTC B0085 and DTC B0088). Therefore a short to ground or short to voltage in either of these signal circuits can set a DTC for both circuits, and an open in either circuit should only set its corresponding DTC.

Only DTC B0085 or B0088 is set

1. Vehicle OFF, disconnect the harness connector at the appropriate B63 side impact sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 inflatable restraint sensing and diagnostic module.
 - **If less than 10 Ω**
3. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
4. Test for less than 2 Ω between the signal circuit terminal 1 at the B63 side impact sensor and the K36 inflatable restraint sensing and diagnostic module terminal listed below:
 - Left front signal terminal 19 X2
 - Right rear signal terminal 30 X2
 - **If 2 Ω or greater**
 Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

5. Vehicle OFF, reconnect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
6. Vehicle in Service Mode, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
7. Verify DTC B0085 or B0088 is not set.

- **If DTC B0085 or B0088 is set**

Replace the appropriate B63 side impact sensor.

- **If DTC B0085 or B0088 is not set**

8. All OK.

Both DTC B0085 and B0088 are set

1. Vehicle OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 1 V between the signal circuit terminals listed below and ground:
 - Left front signal circuit - terminal 19 X2
 - Right rear signal circuit - terminal 30 X2
 - **If 1 V or greater**
 1. Disconnect the harness connector at the B63 side impact sensor that failed the test.
 2. Test for less than 1 V between signal circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, replace the B63 side impact sensor.
 - **If less than 1 V**
3. Test for greater than 50k Ω between each signal circuit listed below and ground:
 - Left front signal circuit - terminal 19 X2
 - Right rear signal circuit - terminal 30 X2
 - **If 50k Ω or less**
 1. Disconnect the harness connector at the B63 side impact sensor that failed the test.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the B63 side impact sensor.
 - **If greater than 50k Ω**
4. Replace the K36 inflatable restraint sensing and diagnostic module.

Circuit/System Verification

NOTE:

- Refer to **SIR Service Precautions**.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Side impact sensor

- Inflatable restraint sensing and diagnostic module
- Front impact sensor wiring harness connector
- Side impact sensor wiring harness connector
- Inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify that DTC B0086 or B0087 symptom byte 3A, 39 or 71 is not set as current.

- **If DTC B0086 or B0087 symptom byte 3A, 39 or 71 is set as current**

Replace the appropriate B63 side impact sensor

- **If DTC B0086 or B0087 symptom byte 3A, 39 or 71 is not set as current**

2. Verify that DTC B0086 or B0087 symptom byte 02 or 05 is set as current.

- **If only DTC B0086 symptom byte 02 or 05 is set as current**

Refer to Circuit/System Testing - Only DTC B0086 or B0087 is set.

- **If only DTC B0087 symptom byte 02 or 05 is set as current**

Refer to Circuit/System Testing - Only DTC B0086 or B0087 is set.

- **If both DTC B0086 or B0087 symptom byte 02 or 05 is set as current**

Refer to Circuit/System Testing - Both DTC B0086 and B0087 are set.

- **If DTC B0086 or B0087 symptom byte 02 or 05 is not set as current**

3. All OK.

Circuit/System Testing

NOTE: The signal circuit is shared at the K36 inflatable restraint sensing and diagnostic module between the B63RF side impact sensor right front and the B63LR side impact sensor left rear (DTC B0086 and DTC B0087). Therefore a short to ground or short to voltage in either of these signal circuits can set a DTC for both circuits, and an open in either circuit should only set its corresponding DTC.

Only DTC B0086 or B0087 is set

1. Vehicle OFF, disconnect the harness connector at the appropriate B63 side impact sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 inflatable restraint sensing and diagnostic module.
 - **If less than 10 Ω**
3. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
4. Test for less than 2 Ω between the signal circuit terminal 1 at the B63 side impact sensor and the K36 inflatable restraint sensing and diagnostic module terminal listed below:
 - Right front signal terminal 22 X2
 - Left rear signal terminal 27 X2
 - **If 2 Ω or greater**

Repair the open/high resistance in the circuit.
 - **If less than 2 Ω**
5. Vehicle OFF, reconnect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
6. Vehicle in Service Mode, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
7. Verify DTC B0086 or B0087 is not set.
 - **If DTC B0086 or B0087 is set**

Replace the appropriate B63 side impact sensor.
 - **If DTC B0086 or B0087 is not set**
8. All OK.

Both DTC B0086 and B0087 are set

1. Vehicle OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for greater than 50k Ω between each signal circuit listed below and ground:
 - Right front signal circuit - terminal 22 X2
 - Left rear signal circuit - terminal 27 X2
 - **If 50k Ω or less**
 1. Disconnect the harness connector at the B63 side impact sensor that failed the test.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the B63 side impact sensor.

- **If greater than 50k Ω**

3. Test for less than 1 V between the signal circuit terminals listed below and ground:

- Right front signal circuit - terminal 22 X2
- Left rear signal circuit - terminal 27 X2

- **If 1 V or greater**

1. Disconnect the harness connector at the B63 side impact sensor that failed the test.

2. Test for less than 1 V between signal circuit and ground.

- If 1 V or greater, repair the short to voltage in the circuit.
- If less than 1 V, replace the B63 side impact sensor.

- **If less than 1 V**

4. Replace the K36 inflatable restraint sensing and diagnostic module.

DTC B0680 04

Passenger Air Bag Off Indicator Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag OFF Indicator Control	B0680 02	B0680 04	B0680 01	-
Passenger Air Bag ON Indicator Control	B067F 02	B067F 04	B067F 01	-
Passenger Air Bag Disable Indicator Ground	-	B067F 04, B0680 04	-	-

Circuit/System Description

The passenger air bag ON/OFF indicators are used to notify the driver when the passenger presence system has enabled or disabled the passenger instrument panel air bag. When the ignition is turned ON, the ignition voltage is supplied to the passenger presence module. When the inflatable restraint sensing and diagnostic module (SDM) receives the appropriate serial data message from the passenger presence module the SDM will then provide voltage to the appropriate indicator.

Conditions for Running the DTC

Ignition Voltage is between 9 - 16 V

Conditions for Setting the DTC

The SDM detects improper voltage on the control circuit of the passenger air bag ON or OFF indicator

Actions Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- Passenger air bag ON and OFF indicators are disabled.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Circuit/System Verification

NOTE: The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTCs before proceeding with this diagnostic.

1. Ignition ON.
2. With a scan tool command the passenger air bag ON indicator and passenger air bag OFF indicator ON and OFF. The respective indicators should turn ON and OFF as commanded.
3. Verify the passenger air bag ON indicator and passenger air bag OFF indicators turn ON and OFF when commanded ON and OFF with a scan tool.

- **If the passenger air bag indicators do not change**

Refer to Circuit/System Testing

- **If the passenger air bag indicators change**

4. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- **Passenger air bag disable on/off indicator.**
- **Passenger air bag disable on/off indicator wiring harness.**

1. Ignition OFF, disconnect the harness connector at the S48B Multifunction Switch - Instrument Panel.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

- **If 10 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 10 Ω**

3. Ignition ON, with a scan tool, command the passenger air bag OFF indicator OFF.

4. Test for less than 11 V between the control circuit terminal 11 and ground.

- **If 11 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. With a scan tool, command the passenger air bag OFF indicator ON.

6. Test for greater than 4 V between the control circuit terminal 11 and ground.

- **If 4 V or less**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

3. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 4 V**

7. With a scan tool, command the passenger air bag ON indicator OFF.

8. Test for less than 11 V between the control circuit terminal 12 and ground.

- **If 11 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

9. With a scan tool, command the passenger air bag ON indicator ON.

10. Test for greater than 4 V between the control circuit terminal 12 and ground.

- **If 4 V or less**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

3. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
- **If greater than 4 V**

11. Replace the S48B Multifunction Switch - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Roof Console Replacement**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming and setup

DTC B1001: OPTION CONFIGURATION (INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

DTC Descriptor

DTC B1001 00

Option Configuration

Circuit/System Description

The inflatable restraint sensing and diagnostic module stores a primary data key, which is a 4-digit number. When the ignition is turned ON, the inflatable restraint sensing and diagnostic module compares this information to the information stored in the body control module (BCM) via serial data. If there is a mismatch between the information stored in the inflatable restraint sensing and diagnostic module and body control module, DTC B1001 will set.

Conditions for Running the DTC

System voltage is between 9 - 16 V.

Conditions for Setting the DTC

The 4-digit Primary Data Key stored in the inflatable restraint sensing and diagnostic module does not match the 4 digits stored in the body control module.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module disables all deployments.

Conditions for Clearing the DTC

The last 4-digit Primary Data Key in the inflatable restraint sensing and diagnostic module matches the last 4 digits stored in the Body Control Module.

Diagnostic Aids

- This DTC is an indication that an incorrect inflatable restraint sensing and diagnostic module is installed in the vehicle, or that the inflatable restraint sensing and diagnostic module and/or the body control module was replaced without reprogramming the body control module with the new information.
- If the inflatable restraint sensing and diagnostic module was previously programmed and DTC B1001 is now set, the setup portion of program was not completed. Proceed to the inflatable restraint sensing and diagnostic module setup portion of the [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#)

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B1001 00

Option Configuration Error

Circuit/System Description

The Inflatable Restraint Sensing and Diagnostic Module (SDM) stores a 4-digit primary key for the Passenger Presence Module. The Inflatable Restraint Sensing and Diagnostic Module sends the Passenger Presence Module the primary key. If the Passenger Presence Module determines that it is the wrong primary key, the Passenger Presence Module will set DTC B1001 and send the Inflatable Restraint Sensing and Diagnostic Module a vehicle mismatch message. The Inflatable Restraint Sensing and Diagnostic Module then will set DTC B0081 and illuminate the SIR warning indicator. The Passenger Presence Module does not use a secondary key.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 volts.

Conditions for Setting the DTC

The 4-digit primary key stored in the Inflatable Restraint Sensing and Diagnostic Module does not match the 4-digit key stored in the Passenger Presence Module.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment is disabled.

Conditions for Clearing the DTC

The 4-digit Primary Key in the Inflatable Restraint Sensing and Diagnostic Module and in the Passenger

Presence Module match.

Diagnostic Aids

This DTC is an indication that the passenger presence system module was not set-up correctly, is not the correct part number or that the Passenger Presence Module is defective.

Circuit/System Verification

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- **Passenger Presence Module**
- **Passenger Presence Module wiring harness**

1. Verify the correct K85 Passenger Presence Module part number has been installed

- **If the K85 Passenger Presence Module installed has an incorrect part number**

Replace the K85 Passenger Presence Module.

- **If the K85 Passenger Presence Module installed has a correct part number**

2. Verify that DTC B1001 is not set as current in the K85 Passenger Presence Module.

- **If DTC is set as current. If Inflatable Restraint Sensing and Diagnostic Module part number**

is correct

1. Verify the Inflatable Restraint Sensing and Diagnostic Module part number is correct.
 - If the K36 Inflatable Restraint Sensing and Diagnostic Module part number is incorrect, replace the K36 Inflatable Restraint Sensing and Diagnostic Module
 - If the K36 Inflatable Restraint Sensing and Diagnostic Module part number is correct
2. Replace the K85 Passenger Presence Module
 - **If the DTC is no set as current**
3. All OK.

Repair Instructions

[Control Module References](#) for K85 Passenger Presence Module and K36 Inflatable Restraint Sensing and Diagnostic Module replacement, setup, and programming

DTC B1019: SYSTEM CONFIGURATION ERROR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B1019 00

System Configuration Error

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) monitors the number of safety components installed on the vehicle. When the Vehicle is turned ON, the Inflatable Restraint Sensing and Diagnostic Module evaluates the number of safety components installed and compares it to the number of components the Inflatable Restraint Sensing and Diagnostic Module expects to see on the vehicle with its current calibration. If there is a mismatch between detected components and the components programmed with the Inflatable Restraint Sensing and Diagnostic Module calibration, DTC B1019 will set. The components (if equipped) that the Inflatable Restraint Sensing and Diagnostic Module will detect include inflatable restraint deployment loops, impact sensors, passenger presence system components, seat position sensors, disable switches, and seat belt switches.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

The setup for the Inflatable Restraint Sensing and Diagnostic Module has not been completed and the Inflatable Restraint Sensing and Diagnostic Module does not detect the correct number of sensors or deployment loops

than is expected with this calibration.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the Instrument Cluster to illuminate the AIR BAG warning indicator.
- The DTC must be cleared before running the setup Inflatable Restraint Sensing and Diagnostic Module.
- Air bag indicator will continue to flash until Inflatable Restraint Sensing and Diagnostic Module setup procedure is complete.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

The Inflatable Restraint Sensing and Diagnostic Module scan tool deployment loop and impact sensor data will match what the Inflatable Restraint Sensing and Diagnostic Module has been programmed to expect to see on the vehicle. B1019 DTC will set if a deployment loop or impact sensor is added or removed from the system.

DTC B1019 will set when an open/high resistance DTC sets for a deployment loop or impact sensor. This causes mismatch between the learned and actual components connected to the Inflatable Restraint Sensing and Diagnostic Module.

DTC B1019 can set with no other DTCs if an unused deployment loop or impact sensor circuit is shorted to ground. This causes a mismatch between the learned and actual components connected to the Inflatable Restraint Sensing and Diagnostic Module.

[Circuit/System Verification](#)

NOTE: DTC B1019 can set after the inflatable restraint sensing and diagnostic module has been replaced and/or reprogrammed before the setup procedure is completed. The setup procedure cannot be completed if DTC B1019 is set as current or history. If a short or open is detected in a deployment circuit prior to the setup procedure being performed, the inflatable restraint sensing and diagnostic module will set DTC B1019.

1. Vehicle in Service Mode.
2. Verify no other Inflatable Restraint Sensing and Diagnostic Module DTCs are set.
 - **If other inflatable restraint sensing and diagnostic module DTCs are set**

Diagnose those DTCs first. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)
 - **If no other inflatable restraint sensing and diagnostic module DTCs are set**
3. Verify the impact sensors called out in the scan tool data list match the number of actual impact sensors installed on the vehicle.
 - **If the number of impact sensors do not match**
 1. Verify the correct Inflatable Restraint Sensing and Diagnostic Module calibration file is loaded in the inflatable restraint sensing and diagnostic module.
 - If the inflatable restraint sensing and diagnostic module calibration file is correct and the vehicle contains an incorrect number of sensors, identify which sensors are missing to make the vehicle match the inflatable restraint sensing and diagnostic module impact sensor calibration scan tool data list.
 - If the calibration file is incorrect
 2. Reprogram the Inflatable Restraint Sensing and Diagnostic Module. Refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#)
 - **If the number of impact sensors match**
4. Verify the enabled deployment loops called out in the scan tool data list match the deployment loops installed on the vehicle.
 - **If the number of enabled deployment loops do not match**
 1. Verify the correct Inflatable Restraint Sensing and Diagnostic Module calibration file is loaded in the inflatable restraint sensing and diagnostic module.
 - If the inflatable restraint sensing and diagnostic module calibration file is correct and the vehicle contains an incorrect number of loops, identify which deployment loops are missing to make the vehicle match the inflatable restraint sensing and diagnostic module impact sensor calibration scan tool data list.
 - If the calibration file is incorrect

2. Reprogram the Inflatable Restraint Sensing and Diagnostic Module. Refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#)

- **If the number of enabled deployment loops match**

5. Verify a passenger presence system is equipped on the vehicle.

- **If a passenger presence system is not equipped on the vehicle**

Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If a passenger presence system is equipped on the vehicle**

6. Verify the passenger presence enable status called out in the scan tool data list is enabled.

- **If the passenger presence enable status is not enabled**

Refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#)

- **If the passenger presence is enabled**

7. Verify the passenger presence learn status called out in the scan tool data list is learned.

- **If the passenger presence learn status is not learned**

1. Verify the scan tool can communicate with the passenger presence system.

- If the scan tool will not communicate with the passenger presence system, refer to [Scan Tool Does Not Communicate with Low Speed GMLAN Device](#)
- If the scan tool communicates

2. Vehicle OFF, disconnect the scan tool, wait two minutes.

3. Vehicle in Service Mode, verify DTC B1019 is not set as current.

- If the DTC is set as current, refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#)
- If the DTC is not set as current

4. All OK.

- **If the passenger presence learn status is learned**

8. Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

PASSENGER PRESENCE SYSTEM REZEROING

Introduction

The inflatable restraints passenger presence system is a calibrated system that requires re-zeroing or a zero check anytime the seat cushion trim attachments have been removed or the passenger presence system has been replaced. The procedures below are designed to assist in the re-zeroing of the passenger presence system.

Before you start, read these procedures carefully and completely. For further information regarding the passenger presence system refer to [Supplemental Inflatable Restraint System Description and Operation](#).

NOTE: The following procedures must be followed:

1. Read this procedure carefully and completely.
2. The passenger presence system will not function properly if the passenger presence system re-zeroing procedure is not performed.
3. Perform the [Diagnostic Repair Verification](#) after successfully completing the re-zeroing procedure to ensure the system is functioning properly.

Passenger Presence System Re-zeroing Procedure

NOTE:

- Before the passenger presence system can be re-zeroed the front passenger seat must be completely empty of all items. The presence of any items on the front passenger seat will affect the calibration and operation of the passenger presence system.
- DTC B0081 will set if the re-zero system test is performed with:
 - An aftermarket seat heater located too close to the sensor mat
 - A scan tool, laptop, or other electronic device is in the seat
 - The seat is damp or wet
 - An object or person is in the seat

1. Make sure that temperature is between 32Â°F to 100Â°F before running a Re-zero procedure.
2. Empty the front outboard passenger seat.
3. Verify that all SIR and passenger presence system components, connectors, and connector position assurances are properly connected and mounted.
4. Install a scan tool.

NOTE: The presence of current DTCs, except DTC B0081 4A or B0081 4B, will prevent the passenger presence system from re-zeroing and may set additional DTCs.

5. Vehicle ON, with a scan tool, perform the Passenger Presence Sensor Learn procedure.
6. If the test fails, confirm that the seat is empty. Perform the Passenger Presence Sensor Learn test again. If the test fails again, verify DTC B0081 is not set as current. If the DTC is set refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) . If the test successfully completed, Vehicle OFF.
7. After the passenger presence system has been successfully re-zeroed, perform the [Diagnostic Repair Verification](#) .

SYMPTOMS - SIR

IMPORTANT: Complete the following steps before using the symptom tables:

1. Perform [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all

of the following are true:

- There are no DTCs set.
- The inflatable restraint sensing and diagnostic module (SDM) can communicate via the serial data link.

2. Review the SIR system description and operation in order to familiarize yourself with the system functions. Refer to [Supplemental Inflatable Restraint System Description and Operation](#).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the SIR system. Refer to [Checking Aftermarket Accessories](#).
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#).

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

[Airbag Indicator Malfunction \(Driver\)](#)[Airbag Indicator Malfunction \(Passenger\)](#) in order to diagnose the symptom.

AIRBAG INDICATOR MALFUNCTION (DRIVER)

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

With the Vehicle in Service Mode, during the bulb check, the driver air bag indicator will flash, and then turn OFF after the bulb check. The Inflatable Restraint Sensing and Diagnostic Module (SDM) performs diagnostic tests on the SIR system during the bulb check. If any malfunction exists the Inflatable Restraint Sensing and Diagnostic Module will request the instrument cluster to illuminate the air bag indicator steady, via serial data. If a preexisting malfunction exists, the air bag indicator will illuminate steady immediately after the ignition is turned ON. If the ignition 1 voltage is outside of the normal operating voltage range of 9 - 16 V, the Inflatable Restraint Sensing and Diagnostic Module will command the instrument cluster to illuminate the air bag indicator ON, even with no DTCs present, and then disable all deployment loops.

Diagnostic Aids

- A DTC B1370 may set if the ignition 1 circuit is outside the 9 - 16 V range.
- A flashing driver air bag indicator is displayed if the inflatable restraint sensing and diagnostic module was programmed but did not fully complete the programming. For a flashing driver airbag indicator, refer

to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#) .

- [Circuit Testing](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Connector Repairs](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

If the driver air bag indicator is flashing, refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#) .

Circuit/System Testing

1. Vehicle in Service Mode. With a scan tool, verify Inflatable Restraint Sensing and Diagnostic Module DTCs are not set.

- **If Inflatable Restraint Sensing and Diagnostic Module DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If Inflatable Restraint Sensing and Diagnostic Module DTCs are not set**

2. With a scan tool command the Instrument Cluster to turn all instrument cluster indicators ON and OFF. The air bag indicator should turn ON and OFF as commanded.

- **If air bag indicator does not turn on or off**

If the air bag indicator does not turn ON and OFF as expected, replace the P16 Instrument Cluster.

- **If air bag indicator does turn on or off**

3. Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [SIR/SRS Wiring Repairs](#)
- [Control Module References](#) for Instrument Cluster or Inflatable Restraint Sensing and Diagnostic Module replacement, programming and setup

AIRBAG INDICATOR MALFUNCTION (PASSENGER)

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B067F 01

Passenger Air Bag On Indicator Circuit Short to Battery

DTC B067F 02

Passenger Air Bag On Indicator Circuit Short to Ground

DTC B067F 04

DTC B0680 01

Passenger Air Bag Off Indicator Circuit Short to Battery

DTC B0680 02

Passenger Air Bag Off Indicator Circuit Short to Ground

DTC B0680 04

Passenger Air Bag Off Indicator Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag OFF Indicator Control	B0680 02	B0680 04	B0680 01	-
Passenger Air Bag ON Indicator Control	B067F 02	B067F 04	B067F 01	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag Disable Indicator Ground	-	B067F 04, B0680 04	-	-

Circuit/System Description

The passenger air bag ON/OFF indicators are used to notify the driver when the passenger presence system has enabled or disabled the passenger instrument panel air bag. When the ignition is turned ON, the ignition voltage is supplied to the passenger presence module. When the inflatable restraint sensing and diagnostic module (SDM) receives the appropriate serial data message from the passenger presence module the SDM will then provide voltage to the appropriate indicator.

Conditions for Running the DTC

Ignition Voltage is between 9 - 16 V

Conditions for Setting the DTC

The SDM detects improper voltage on the control circuit of the passenger air bag ON or OFF indicator

Actions Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- Passenger air bag ON and OFF indicators are disabled.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Control Module References for scan tool information

Circuit/System Verification

NOTE: The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTCs before proceeding with this diagnostic.

1. Ignition ON.
2. With a scan tool command the passenger air bag ON indicator and passenger air bag OFF indicator ON and OFF. The respective indicators should turn ON and OFF as commanded.
3. Verify the passenger air bag ON indicator and passenger air bag OFF indicators turn ON and OFF when commanded ON and OFF with a scan tool.

- **If the passenger air bag indicators do not change**

Refer to Circuit/System Testing

- **If the passenger air bag indicators change**

4. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- **Passenger air bag disable on/off indicator.**
- **Passenger air bag disable on/off indicator wiring harness.**

1. Ignition OFF, disconnect the harness connector at the S48B Multifunction Switch - Instrument Panel.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

- **If 10 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 10 Ω**

3. Ignition ON, with a scan tool, command the passenger air bag OFF indicator OFF.
4. Test for less than 11 V between the control circuit terminal 11 and ground.

- **If 11 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. With a scan tool, command the passenger air bag OFF indicator ON.

6. Test for greater than 4 V between the control circuit terminal 11 and ground.

- **If 4 V or less**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

3. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 4 V**

7. With a scan tool, command the passenger air bag ON indicator OFF.

8. Test for less than 11 V between the control circuit terminal 12 and ground.

- **If 11 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

9. With a scan tool, command the passenger air bag ON indicator ON.

10. Test for greater than 4 V between the control circuit terminal 12 and ground.

- **If 4 V or less**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

3. Test for less than 2 Ω in each control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 4 V**

11. Replace the S48B Multifunction Switch - Instrument Panel.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Roof Console Replacement](#)

- [Control Module References](#) for inflatable restraint sensing and diagnostic module replacement, programming and setup

SIR DISABLING AND ENABLING

SIR component location affects how a vehicle should be serviced. There are parts of the SIR system installed in various locations around a vehicle. To find the location of the SIR components refer to [Master Electrical Component List](#).

There are several reasons for disabling the SIR system, such as repairs to the SIR system or servicing a component near or attached to an SIR component. There are several ways to disable the SIR system depending on what type of service is being performed. The following information covers the proper procedures for disabling/enabling the SIR system.

Condition	Action
If the vehicle was involved in an accident with an air bag deployment.	Disconnect the negative battery cable(s)
When performing SIR diagnostics.	Follow the appropriate SIR service manual diagnostic procedure(s) *
When moving, removing or replacing an SIR component or a component attached to an SIR component. (Anytime you remove fasteners.)	Disconnect the negative battery cable(s) *
If the vehicle is suspected of having shorted electrical wires.	Disconnect the negative battery cable(s) *
When performing electrical diagnosis on components other than the SIR system.	Remove the SIR/Airbag fuse(s) when indicated by the diagnostic procedure to disable the SIR system
* DTCs will be lost when the negative battery cable is disconnected.	

SIR Service Precautions

WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Failure to observe the correct procedure could cause deployment of the SIR components. Serious injury can occur. Failure to observe the correct procedure could also result in unnecessary SIR system repairs.

The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the air bags if the Inflatable Restraint Sensing and Diagnostic Module loses battery power during a collision. Deployment power is available for as much as 2 minutes after disconnecting the vehicle power. Waiting 2 minutes before working on the system after disabling the SIR system prevents deployment of the air bags from the reserved energy supply.

General Service Instructions

The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 65°C (149°F).
- Verify the correct replacement part number. Do not substitute a component from a different vehicle.
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system.

Discard any of the following components if it has been dropped from a height of 92 cm (3 feet) or greater:

- Inflatable Restraint Sensing and Diagnostic Module (SDM)
- Any air bag
- Driver steering wheel air bag coil
- Any impact sensor
- Seat belt anchor and/or retractor pretensioners
- Passenger presence module and/or occupant sensor

Disabling Procedure - Air Bag Fuse

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Vehicle OFF.

WARNING: The SDM may have more than one fused power input. To ensure there is no unwanted SIR deployment, personal injury, or unnecessary SIR system repairs, remove all fuses supplying power to the SDM. With all SDM fuses removed and the ignition switch in the ON position, the AIR BAG warning indicator illuminates. This is normal operation, and does not indicate a SIR system malfunction.

3. Locate and remove the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to [SIR Schematics](#), or [Electrical Center Identification Views](#) .
4. Wait 2 minutes before working on the system.

Enabling Procedure - Air Bag Fuse

1. Vehicle OFF.
2. Install the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to [SIR Schematics](#), or [Electrical Center Identification Views](#) .
3. Vehicle in Service Mode. The AIR BAG indicator will flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to [Diagnostic System Check - Vehicle](#) .

Disabling Procedure - Negative Battery Cable

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Vehicle OFF.
3. Disconnect the negative battery cable from the battery. Refer to [Battery Negative Cable Disconnection and Connection](#) .
4. Wait 2 minutes before working on system.

Enabling Procedure - Negative Battery Cable

1. Vehicle OFF.
2. Connect the negative battery cable to the battery. Refer to [Battery Negative Cable Disconnection and](#)

Connection .

3. Vehicle in Service Mode. The AIR BAG indicator will flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to Diagnostic System Check - Vehicle .

REPAIR INSTRUCTIONS

SIR SERVICE PRECAUTIONS

General Service Instructions

WARNING: If a service procedure indicates that a module is to be replaced, a new production unit **MUST** be ordered from the GM Parts Catalog or certified supplier. Using a module that has been reset by a 3rd party company is strictly prohibited. Not using a new production unit may result in improper performance of the safety system in the event of an accident, which may result in bodily injury.

WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

WARNING: Do not strike or jolt the inflatable restraint sensing and diagnostic module (SDM). Before applying power to the SDM, make sure that it is securely fastened with the arrow facing toward the front of the vehicle. Failure to observe the correct installation procedure could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

NOTE: The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the SIR air bags. Deployment power may be available for up to 2 minutes after disconnecting the vehicle power. Disabling the SIR system prevents deployment of the SIR air bags from the reserved energy supply.

NOTE: The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 85 °C (185 °F)
- Verify the correct replacement part number. Do not substitute a component from a different vehicle
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system

NOTE: Discard any of the following components if it has been dropped from a height of 80 cm (31.49 in) or greater:

- Inflatable Restraint Sensing and Diagnostic Module

- Passenger instrument panel air bag
- Driver steering wheel air bag
- Driver steering wheel air bag coil
- Roof rail air bags
- Front and /or side impact sensors
- Seat belt anchor and/or retractor pretensioners
- Front seat side air bag
- Knee air bag

STEERING WHEEL AIRBAG REPLACEMENT

Fig. 10: Steering Wheel Airbag

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning . WARNING: Refer to SIR Inflator Module Handling and Storage Warning . Preliminary Procedures SIR Disabling and Enabling	
1	Steering Wheel Airbag WARNING: After installation of the steering wheel airbag module to

Callout	Component Name
	the steering wheel, slightly pull the module outward. If there is no give on the airbag module then it is secured correctly. If the airbag module is not fully attached personal injury could result. Procedure 1. Fully Insert a long 3 mm allen wrench or equivalent tool into access holes on the rear left and right side of the steering wheel. 2. Apply and keep constant pressure on handle towards front of vehicle to push the spring fastener inward to release the steering wheel airbag from the steering wheel. 3. Release the connector position assurance (CPA) retainer. 4. Disconnect the electrical connectors. 5. <u>Inflatable Restraint Module Handling and Scrapping</u>

STEERING WHEEL AIRBAG COIL REPLACEMENT

Fig. 11: Steering Wheel Airbag Coil
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures <u>Steering Wheel Replacement</u> <u>Steering Column Lower Trim Cover Replacement</u> - Reposition the steering column upper trim cover as necessary.	
1	Steering Wheel Airbag Coil Procedure - Disconnect the electrical connectors. - Release the retaining tabs and remove the steering wheel airbag coil from the steering column. - Ensure the steering wheel airbag coil is CENTERED during installation. <u>Airbag Steering Wheel Module Coil Centering</u>

AIRBAG STEERING WHEEL MODULE COIL CENTERING

Fig. 12: Steering Wheel Airbag Coil

Courtesy of GENERAL MOTORS COMPANY

CAUTION: The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.

1. Inspect the steering wheel airbag coil. If the yellow lock pin (1) is present, the uplead post (2) is at the 12 o'clock position and the loop (u-turn) appears in the centering window (3) then the coil is already in the centered position and no further action is required.

Fig. 13: Block Tooth

Courtesy of GENERAL MOTORS COMPANY

2. If the steering wheel airbag coil needs to be centered, perform the following preliminary steps:
 1. Ensure the wheels on the vehicle are straight ahead.
 2. Ensure the block tooth (1) on the steering shaft is in the 6 o'clock position.

Fig. 14: Centering Steering Wheel Airbag Coil
Courtesy of GENERAL MOTORS COMPANY

3. To center the steering wheel airbag coil, perform the following steps:
 1. Hold the coil with the face up.
 2. Slowly rotate the coil hub clockwise until the coil ribbon stops.
 3. Slowly rotate the coil hub counterclockwise approximately 2.5 turns until the uplead post (1) is at the 12 o'clock position.
 4. View the centering window (2) and ensure the loop (u-turn) is visible. If the loop is visible then the coil is in the center position.
 5. While holding the coil hub in the center position, align the coil with the steering column components and slide the coil onto the steering shaft.

INSTRUMENT PANEL AIRBAG REPLACEMENT

Fig. 15: Instrument Panel Airbag

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Inflator Module Handling and Storage Warning . WARNING: Refer to SIR Warning . Preliminary Procedures 1. Disable the SIR system. SIR Disabling and Enabling 2. Instrument Panel Assembly Replacement	
1	Instrument Panel Airbag Procedure 1. Inflatable Restraint Module Handling and Scrapping

Callout	Component Name
	2. Insert a wood straight edge, one per side behind all locking tabs, to simultaneously release the instrument panel airbag housing from the instrument panel chute without overextending the airbag locking tabs. Use a wood straight edge that is approximately 50.8 cm (20 in) long and 5 mm (0.20 in) thick with a rounded edge. 3. Enable the SIR System. SIR Disabling and Enabling

INSTRUMENT PANEL LOWER AIRBAG REPLACEMENT - DRIVER SIDE

Fig. 16: Instrument Panel Lower Airbag - Driver Side
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Inflator Module Handling and Storage Warning . WARNING: Refer to SIR Warning .	

Callout	Component Name
Preliminary Procedure 1. Disable the SIR system. SIR Disabling and Enabling 2. Instrument Panel Knee Bolster Replacement	
1	Instrument Panel Lower Airbag Nut (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
2	Instrument Panel Lower Airbag - Driver Side Procedure 1. Disconnect the electrical connector. 2. Inflatable Restraint Module Handling and Scrapping 3. Enable the SIR System. SIR Disabling and Enabling NOTE: Instrument panel airbag lower bracket shares the same fasteners and will need to be reinstalled in the correct direction.

INSTRUMENT PANEL LOWER AIRBAG REPLACEMENT - PASSENGER SIDE

Fig. 17: Instrument Panel Lower Airbag - Passenger Side

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Inflator Module Handling and Storage Warning . WARNING: Refer to SIR Warning . Preliminary Procedure SIR Disabling and Enabling	
1	Instrument Panel Lower Airbag Nut (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten

Callout	Component Name
	9 N.m (80 lb in)
2	Instrument Panel Lower Airbag - Passenger Side Procedure 1. Disconnect the electrical connector. 2. <u>Inflatable Restraint Module Handling and Scrapping</u> 3. <u>SIR Disabling and Enabling</u>

AIRBAG FRONT PASSENGER PRESENCE MODULE REPLACEMENT

Fig. 18: Airbag Front Passenger Presence Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> . WARNING: To avoid personal injuries, re-zero the	

Callout	Component Name
passenger presence system whenever you remove or replace the seat cushion or trim. Failure to do so may cause the system to malfunction.	
Preliminary Procedure Front Seat Cushion Cover and Pad Replacement	
1	Front Seat Cushion Cover
2	Front Seat Cushion Pad
3	Airbag Front Passenger Presence Module Assembly Procedure 1. Remove the hog rings that attach the passenger presence system to the foam cushion pad. 2. Remove the passenger presence system from the foam cushion pad and heater assembly, if equipped. 3. Note the routing of the wiring harness and connector location for installation. 4. Control Module References for programming or setup information, if required.

FRONT AND REAR ROW SEAT ROOF RAIL AIRBAG REPLACEMENT

Fig. 19: Front And Rear Row Seat Roof Rail Airbag

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning . WARNING: Refer to SIR Inflator Module Handling and Storage Warning . Preliminary Procedures 1. SIR Disabling and Enabling	

Callout	Component Name
2. It is only necessary to lower the headliner. Only do those steps in headliner replacement that will lower the headliner enough to gain access to the part. Headlining Trim Panel Replacement	
1	Front and Rear Row Seat Roof Rail Airbag Fastener (Qty: 8) CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
2	Front and Rear Row Seat Roof Rail Airbag Retainer (Qty: 8)
3	Front and Rear Row Seat Roof Rail Airbag Procedure 1. Disconnect the electrical connector. 2. Remove the roof side rail inflatable restraint module from the vehicle. 3. Inflatable Restraint Module Handling and Scrapping

FRONT SEAT OUTBOARD SEAT BACK AIRBAG REPLACEMENT

Fig. 20: Front Seat Outboard Seat Back Airbag

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary: • The seat cushion frame • The seat recliner, if equipped • The seat adjuster • The seat back frame Failure to do so may cause future personal injury. Preliminary Procedure <u>Driver or Passenger Seat Back Cover and Pad Replacement</u>	
1	Front Seat Outboard Seat Back Airbag Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Reposition the wiring harness.

Callout	Component Name
	2. Remove the protective caps from the nuts. Tighten 3.5 N.m (31 lb in)
2	Front Seat Outboard Seat Back Airbag Procedure 1. Remove the connector position assurance (CPA) from the module electrical connector. 2. Disconnect the electrical connector. 3. <u>Inflatable Restraint Module Handling and Scrapping</u>

REAR SEAT BOLSTER AIRBAG REPLACEMENT

Fig. 21: Rear Seat Bolster Airbag
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> . WARNING:	

Callout	Component Name
Following the deployment of a rear seat side air bag, inspect the following parts for damage. Replace these parts if necessary: • The rear seat side bolster, attachments, brackets and wiring • The rear seat back frame, cushion and cover • The rear seat cushion frame, cushion and cover Failure to do so may cause future personal injury. Preliminary Procedure Rear Seat Back Bolster Replacement	
1	Rear Seat Back Bolster
2	Rear Seat Bolster Airbag Nut (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 3.25 N.m (29 lb in)
3	Rear Seat Bolster Airbag Procedure

Callout	Component Name
	1. Disconnect the electrical connector. 2. <u>Inflatable Restraint Module Handling and Scrapping.</u>

AIRBAG SIDE IMPACT REAR SENSOR REPLACEMENT

Fig. 22: Airbag Side Impact Rear Sensor
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING:	
Refer to <u>SIR Warning</u> .	
WARNING:	
Refer to <u>SIR Inflator Module Handling and Storage Warning</u> .	
WARNING:	

Callout	Component Name
Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary: • The seat cushion frame • The seat recliner, if equipped • The seat adjuster • The seat back frame Failure to do so may cause future personal injury. Preliminary Procedures 1. SIR Disabling and Enabling 2. Rear Seat Back Bolster Replacement	
1	Airbag Side Impact Rear Sensor CAUTION: Refer to Fastener Caution . Procedure 1. Disconnect the electrical connector. 2. Loosen the fastener and slide the sensor out of the keyhole slot.

Callout	Component Name
	NOTE: Integral sensor assembly bolt uses Left Hand threads. Use counterclockwise rotation to loosen fastener at TORX® tip end. If accessing at pan head end of the fastener, use clockwise rotation to loosen bolt. Tighten 7.5 N.m (66 lb in)

FRONT SEAT BELT RETRACTOR REPLACEMENT

3. <u>Front Seat Belt Anchor Plate Tensioner Cover Replacement</u>	
1	Front Seat Belt Anchor Plate Tensioner Bolt CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 45 N.m (33 lb ft)
2	Front Seat Belt Anchor Plate Tensioner Procedure Disconnect the electrical connector.

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

Accident With or Without Air Bag Deployment - Component Inspections

WARNING: Proper operation of the Supplemental Inflatable Restraint (SIR) sensing system requires that any repairs to the vehicle structure return the vehicle structure to the original production configuration. Not properly repairing the vehicle structure could cause non-deployment of the air bag(s) in a frontal collision or deployment of the air bag(s) for conditions less severe than intended.

After any collision, inspect the following components as indicated. If you detect any damage, replace the component. If you detect any damage to the mounting points or mounting hardware, repair the component or replace the hardware as needed.

- The high voltage system - Inspect the high voltage system. Refer to High Voltage System Inspection .
- The steering column - Inspect the steering column for bending, twisting, buckling or any type of damage.
- The instrument panel knee bolsters and mounting points - Inspect the knee bolsters for bending, twisting, buckling, or any other type of damage.
- The instrument panel brackets, braces, etc. - Inspect for bending, twisting, buckling, or any other type of damage.
- The seat belts - Perform the seat belt operational and functional checks. Refer to Repairs and Inspections Required After a Collision .
- The instrument panel cross car beam - Inspect for bending, twisting, buckling, or any other type of damage.
- The instrument panel mounting points and brackets - Inspect for bending, twisting, buckling, or any other type of damage.
- The seats and seat mounting points - Inspect for bending, twisting, buckling, or any other type of damage.
- The roof and headliner mounting points.
- The brake pedal --Inspect the brake pedal for bending, twisting, buckling or any type of damage.

Accident With Frontal Air Bag Deployment - Component Replacement and Inspections

After a collision involving air bag deployment, replace the following components.

- Driver steering wheel air bag
- Passenger instrument panel air bag, if deployed
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear
- Front and/or side impact sensors
- Driver/Passenger seat side air bag, if deployed
- Seat back cover if side seat air bag is deployed
- Driver/Passenger seat belt anchor and/or retractor pretensioners

Perform additional inspections on the following components.

- Steering wheel air bag coil and the coil wiring pigtail - Inspect for melting, scorching, or other damage due to excessive heat.
- Mounting points or mounting hardware for the passenger instrument panel air bag, steering wheel air bag, SDM, seat side air bag (if deployed) and seat belt anchor and/or retractor pretensioners - Inspect for any damage and repair or replace each component as needed.

Accident With Side Seat Air Bag Deployment - Component Replacement and Inspections

After a collision involving driver/passenger side seat air bag deployment, replace the following components.

- Left/right side impact sensors on the side of the impact.
- Left/right roof rail air bag on the side of the impact.
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear
- Inflatable restraint seat belt anchor and/or retractor pretensioner.
- Driver or passenger seat back cushion cover replacement.

WARNING: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.

Perform additional inspections on the following components.

- Mounting points or mounting hardware for the side impact sensors, and driver/passenger side seat air bags on the side of impact - Inspect for any damage and repair or replace each component as needed.
- Mounting points, mounting hardware, headliner and trim pieces for the left/right roof rail air bag on the side of impact - Inspect for any damage and repair or replace each component as needed.
- Mounting points or mounting hardware for the SDM and seat belt anchor and/or retractor pretensioners - Inspect for any damage and repair or replace each component as needed.
- The seat cushion frame

- The seat recliner and cover, if equipped
- The seat adjuster
- The seat back frame
- Door trim assembly
- Impacted seat cushion side covers and switches

Impact Sensor Replacement Guidelines

The impact sensor replacement policy requires replacing sensors in the area of the accident damage. The area of accident damage is defined as the portion of the vehicle which is crushed, bent, or damaged due to a collision. An example of this would be a moderate collision where the front of the vehicle impacts a object. If the vehicle has an impact sensor mounted forward of the radiator, it must be replaced.

- Replace the impact sensor whether or not the air bags have deployed.
- Replace the impact sensor even if it appears to be undamaged.

Impact sensor damage which is not visible, such as slight bending of the mounting bracket or cuts in the wire insulation, can cause improper operation of the SIR system. Do not try to determine whether the impact sensor is undamaged, replace the impact sensor. Also, if you follow a diagnostic trouble code (DTC) procedure and a malfunctioning impact sensor is indicated, replace the impact sensor.

INFLATABLE RESTRAINT MODULE HANDLING AND SCRAPPING

Special Tools

- **EL-38826** SIR Deployment Harness
- **EL-39401-B** SIR Deployment Fixture

For equivalent regional tools, refer to [Special Tools](#).

Live and Undeployed Air Bag

WARNING: Refer to [SIR Inflator Module Handling and Storage Warning](#) .

Take special care when handling or storing an undeployed air bag. An air bag deployment produces a rapid generation of gas. This may cause the air bag, or an object in front of the air bag, to project through the air in the event of an unlikely deployment.

Dual Stage Air Bags

Dual stage air bags have two deployment stages. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. Therefore, a deployed dual stage air bag must be treated as an active air bag. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.

Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will require the disposal of a live and undeployed air bag. Do NOT dispose a live and undeployed air bag through normal disposal channels until the air bag has been deployed.

Do not deploy the air bag in the following situations:

- After replacement of an air bag under warranty - the air bag may need to be returned undeployed to the manufacturer.
- If the vehicle is the subject of a product liability claim, related to the SIR system and is subject to a preliminary investigation - do NOT alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the air bags - follow the instructions in the campaign service bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.

You can deploy the air bag either inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation:

Deployment Outside Vehicle - Steering Wheel Air Bag, Instrument Panel Air Bag, and Roof Rail Air Bag

Deploy the air bag outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the air bag is malfunctioning.
- The air bag is cosmetically damaged, scratched, or ripped.
- The air bag pigtail is damaged.
- The air bag connector is damaged.
- The air bag connector terminals are damaged.

Deployment and disposal of a malfunctioning air bag is subject to any required retention period.

WARNING: Refer to [SIR Inflator Module Disposal Warning](#) .

1. Vehicle OFF.

WARNING: Refer to [SIR Inflator Module Handling and Storage Warning](#) .

2. Remove the air bag.

Fig. 25: Identifying Clearance For Deployment Of Inflator Module

Courtesy of GENERAL MOTORS COMPANY

3. Clear a space on the ground about 1.85 m (6 ft) in diameter for deployment of the air bag or deployment fixture. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Ensure you have sufficient ventilation.
4. Clear the area of loose or flammable objects.

NOTE:

Dual stage deployments are only used in steering wheel and instrument panel air bags. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.

5. If you are deploying a steering wheel air bag, place the air bag in the center of the space with the vinyl trim cover facing up and away from the surface.

Fig. 26: Identifying I/P Module Components
Courtesy of GENERAL MOTORS COMPANY

6. When deploying an instrument panel air bag, perform the following instructions:
 1. Place the **EL-39401-B** fixture in the center of the cleared area.
 2. Fill the deployment fixture with water or sand.
 3. Using the proper nuts and bolts, mount the instrument panel air bag (1) to the deployment fixture (2), with the vinyl trim facing up.
 4. Securely tighten all fasteners that hold the instrument panel air bag (1) to the deployment fixture (2).

Fig. 27: Identifying Fasteners Holding Side Impact Module To Deployment Fixture
Courtesy of GENERAL MOTORS COMPANY

7. When deploying a roof rail air bag, perform the following instructions:
 1. Place the **EL-39401-B** fixture (3) in the center of the cleared area.
 2. Fill the deployment fixture with water or sand to provide sufficient stabilization of fixture during deployment.
 3. Adjust and secure the fixture arms (4) to the deployment fixture (3), using the proper nuts and bolts.
 4. Attach the roof rail air bag in the deployment fixture and securely tighten all fasteners.

Fig. 28: Identifying SIR Deployment Harness & Adapter

Courtesy of GENERAL MOTORS COMPANY

8. Inspect the **EL-38826** harness and the appropriate pigtail adapter (2) for damage. Replace as needed.
9. Short the 2 SIR deployment harness leads (1) together using one banana plug seated into the other.
10. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).

Fig. 29: Extending SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

11. Extend the SIR deployment harness and adapter to the full length from the deployment fixture or area.

Fig. 30: Identifying Inflator Module, SIR Deployment Harness & Adapter

Courtesy of GENERAL MOTORS COMPANY

NOTE: On a dual stage air bag, both connectors must be attached to the deployment harness adapter. This will ensure that both stage 1 and stage 2 of the deployment loops are energized, regardless of the deployment state.

12. Connect the air bag (1) to the adapter (2) on the SIR deployment harness (3).

NOTE:

- The rapid expansion of gas involved with deploying an air bag is very loud. Notify all the people in the immediate area that you intend to deploy the air bag.
- When the air bag deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the air bag due to the force of the rapid expansion of gas inside the air bag.
- If you are deploying a dual stage air bag with stage 1 already deployed, the fixture may not move and the noise may have been

reduced.

13. Clear the area of people.

Fig. 31: Separating Banana Plugs

Courtesy of GENERAL MOTORS COMPANY

14. Separate the 2 banana plugs on the SIR deployment harness that were shorted together earlier in the procedure.

Fig. 32: Identifying SIR Deployment Harness Wires To Power Source

Courtesy of GENERAL MOTORS COMPANY

15. Place a 12 V minimum/2A minimum power source, such as a vehicle battery, near the shorted end of the harness.
16. Connect the SIR deployment harness wires to the power source. Deployment of the air bag will occur when contact is made.

Fig. 33: View Of Deployment Harness Leads

Courtesy of GENERAL MOTORS COMPANY

17. Disconnect the SIR deployment harness from the power source after the air bag deploys.
18. If the air bag did not deploy, disconnect the adapter and discontinue the procedure and contact the Technical Assistance Group.

If deployment was successful, proceed to the following steps.

WARNING: Refer to [SIR Deployed Inflator Modules Are Hot Warning](#) .

19. Seat one banana plug into the other in order to short the deployment harness leads.
20. Put on a pair of shop gloves.
21. Disconnect the pigtail adapter from the air bag as soon as possible.
22. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
23. Dispose of the deployed air bag through normal refuse channels.

24. Wash your hands with a mild soap.

Deployment Inside Vehicle - Vehicle Scrapping Procedure

Deploy the air bags inside of the vehicle when destroying the vehicle or when salvaging the vehicle for parts. This includes, but is not limited to, the following situations:

- The vehicle has completed all useful life.
- Irreparable damage occurred to the vehicle in a non-deployment type accident.
- Irreparable damage occurred to the vehicle during a theft.
- The vehicle is being salvaged for parts to be used on a vehicle with a different VIN, as opposed to rebuilding as the same VIN.

WARNING: Refer to [SIR Inflatable Module Deployment Outside Vehicle Warning](#) .

1. Lower the driver and passenger windows.
2. Vehicle OFF, and remove the key(s) from vehicle.
3. Check that all air bags which will be deployed are mounted securely.
4. Remove all loose objects from the front seats.

Fig. 34: Identifying I/P Module Connector To Vehicle Harness Connector (LH Side I/P)

Courtesy of GENERAL MOTORS COMPANY

WARNING: A deployed dual stage inflator module will look the same whether one or both stages were used. Always assume a deployed dual stage inflator module has an active stage 2. Improper handling or servicing can activate the inflator module and cause personal injury.

5. Disconnect the steering wheel air bag yellow connector (1) from vehicle harness yellow connector (3).

Fig. 35: Stripping SIR Wires

Courtesy of GENERAL MOTORS COMPANY

NOTE:

If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to [COMPONENT CONNECTOR END VIEWS - INDEX](#) for determining high and low circuits.

6. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
7. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.

Fig. 36: Fabricating 20 Ft. Deployment Harness
Courtesy of GENERAL MOTORS COMPANY

8. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. Use these wires to fabricate the driver deployment harness.
9. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
10. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the air bag.

Fig. 37: Twisting Connector Wire Leads (High Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

11. Twist together the 2 connector wire leads from the high circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
12. Inspect that the 3-wire connection is secure.
13. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.

Fig. 38: Twisting Connector Wire Leads (Low Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

14. Twist together the 2 connector wire leads from the low circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
15. Inspect that the 3-wire connection is secure.
16. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
17. Connect the deployment harness to the connector on the steering wheel air bag.
18. Route the deployment harness out of the driver side of the vehicle.
19. Disconnect the yellow left roof rail harness connector from the vehicle harness connector.
20. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
21. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
22. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
23. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
24. Twist together one end from each of the wires in order to short the wires.

25. Twist together one connector wire lead to one deployment wire.
26. Secure and insulate the connection using electrical tape.
27. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
28. Connect the deployment harness to the yellow connector of the roof rail air bag.
29. Route the deployment harness out of the driver side of the vehicle.

Fig. 39: Identifying I/P Module Connector To Vehicle Harness Connector

Courtesy of GENERAL MOTORS COMPANY

30. Disconnect the instrument panel air bag yellow harness connector (1) from the vehicle harness connector (2).

NOTE: If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** for determining high and low circuits.

31. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
32. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.

33. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
34. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
35. Twist together one end from each of the wires in order to short the wires.
36. Twist together the 2 connector wire leads from the high circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to [COMPONENT CONNECTOR END VIEWS - INDEX](#) in order to determine the correct circuits.
37. Inspect that the 3-wire connection is secure.
38. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
39. Twist together the 2 connector wire leads from the low circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to [COMPONENT CONNECTOR END VIEWS - INDEX](#) in order to determine the correct circuits.
40. Inspect that the 3-wire connection is secure.
41. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
42. Connect the deployment harness to the instrument panel air bag in-line connector.
43. Route the deployment harness out of the passenger side of the vehicle.
44. Disconnect the yellow harness connector to the right roof rail air bag from the vehicle harness connector.
45. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
46. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
47. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
48. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
49. Twist together one end from each of the wires in order to short the wires.
50. Twist together one connector wire lead to one deployment wire.
51. Secure and insulate the connection using electrical tape.
52. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
53. Connect the deployment harness to the roof rail air bag yellow connector.
54. Route the deployment harness out of the passenger side of the vehicle.
55. Completely cover the windshield and the front door window openings with a drop cloth.
56. Stretch to the full length all of the deployment harness wires on the right side of the vehicle.
57. Deploy each deployment loop one at a time.
58. Place a power source, 12 V minimum/2A minimum, such as a vehicle battery, near the shorted end of the harnesses.
59. Separate one set of wires and touch the wire ends to the power source in order to deploy the selected air bag.
60. Disconnect the deployment harness from the power source and twist the wire ends together.
61. Continue the same process with the remaining deployment harnesses.
62. Disconnect all harnesses from the vehicle.
63. Discard the harnesses.
64. Scrap the vehicle in the same manner as a non-SIR equipped vehicle.

65. If one or all of the air bags did not deploy, remove the undeployed air bags from the vehicle.

PRETENSIONER HANDLING AND SCRAPPING

Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) pretensioner. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner. Deploy the pretensioner before disposal. Do not dispose of a live (undeployed) pretensioner through normal disposal channels until the pretensioner has been deployed. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner.

- After replacement of a pretensioner under warranty. The pretensioner may need to be returned undeployed to the original manufacturer of pretensioner.
- If the vehicle is the subject of a Product Liability report related to the SIR system and is subject to a Preliminary Investigation (GM-1241). Do not alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the pretensioners. Follow the instructions in the Campaign Service Bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.

The pretensioner can be deployed inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation.

Deployment Inside the Vehicle

Refer to **Inflatable Restraint Module Handling and Scrapping** for deploying the pretensioner inside vehicle under Vehicle Scrapping Procedure.

Deployment Outside Vehicle for Seat Belt Pretensioners

Deploy the seat belt pretensioners outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the seat belt pretensioner is malfunctioning.
- The pretensioner pigtail (if equipped) is damaged.
- The pretensioner connector is damaged.
- The pretensioner connector terminal is damaged.

Deployment and disposal of a malfunctioning seat belt pretensioner is subject to any required retention period.

WARNING: In order to prevent accidental deployment of the pretensioner which could cause personal injury, do not dispose of an undeployed pretensioner as normal shop waste. The undeployed pretensioner contains substances that could

cause severe illness or personal injury if the sealed container is damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed pretensioner. Failure to dispose of a pretensioner as instructed may be a violation of federal, state, or local laws.

WARNING: When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.

Special Tools

- **EL-39401-B** SIR Deployment Fixture
- **EL-38826** SIR Deployment Harness

Fig. 40: Proper Pretensioner Carrying

Courtesy of GENERAL MOTORS COMPANY

1. Turn the ignition switch to the OFF position.
2. Remove the ignition key.

3. Put on safety glasses.
4. Remove the seat belt pretensioner from the vehicle.
5. When carrying a pretensioner to the deployment area keep the open end of pretensioner pointed away from the body.

Fig. 41: Pretensioner Deployment Area

Courtesy of GENERAL MOTORS COMPANY

6. Clear a space on the ground about 1.85 M (6 ft) in diameter for deployment of the pretensioner. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Make sure you have sufficient ventilation.
7. Make sure no loose or flammable objects are in the area.
8. Place the **EL-39401-B** SIR deployment fixture in the center of the cleared area.
9. Fill the fixture plastic reservoir with water or sand.

Fig. 42: Mounting Pretensioner In SIR Deployment Fixture

Courtesy of GENERAL MOTORS COMPANY

10. Mount the pretensioner (1) in the SIR deployment fixture (3) with the open end facing up using the following mounting method.
 1. Adjust and secure the EL-39401-B arms (4) to the deployment fixture (3).
 2. To mount, use the proper size bolt (2) and nut (5) with washers in order to secure the pretensioner (1) to the deployment fixture brackets (4).
 3. Securely tighten all fasteners prior to deployment.

Fig. 43: Identifying SIR Deployment Harness & Adapter

Courtesy of GENERAL MOTORS COMPANY

11. Inspect the **EL-38826** SIR deployment harness and the appropriate pigtail adapter for damage. Replace as needed.
12. Short the 2 SIR deployment harness (1) leads together using one banana plug seated into the other.
13. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).

Fig. 44: Extending SIR Deployment Harness & Adapter

Courtesy of GENERAL MOTORS COMPANY

14. Extend the SIR deployment harness and adapter to full length from the deployment fixture.

Fig. 45: Connecting Pretensioner To Adapter
Courtesy of GENERAL MOTORS COMPANY

15. Connect the pretensioner (1) to the adapter (2) on the deployment harness (3).

NOTE: The rapid gas expansion involved with deploying a pretensioner is very loud. Notify all the people in the immediate area that you intend to deploy the seat belt pretensioner.

16. Clear the area of people.

Fig. 46: Separating Banana Plugs

Courtesy of GENERAL MOTORS COMPANY

WARNING: When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.

17. Separate the 2 banana plugs on the SIR deployment harness.

Fig. 47: Deploying Pretensioner

Courtesy of GENERAL MOTORS COMPANY

NOTE: When the seat belt pretensioner deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the seat belt pretensioner due to the force of the rapid expansion of gas inside the pretensioner.

18. Place a 12 V minimum/2 A minimum power source (i.e., vehicle battery) near the shorted end of the harness.
19. Connect the SIR deployment harness wires to the power source. Pretensioner deployment will occur when contact is made.
20. Disconnect the SIR deployment harness from the power source after the pretensioner deploys.

Fig. 48: View Of Deployment Harness Leads

Courtesy of GENERAL MOTORS COMPANY

21. Seat one banana plug into the other in order to short the deployment harness leads.
22. If the pretensioner did not deploy, disconnect the adapter and discontinue the procedure. Contact the Technical Assistance Group. Otherwise, proceed to the following steps.
23. Put on a pair of shop gloves.
24. Disconnect the pigtail adapter from the pretensioner as soon as possible.
25. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
26. Dispose of the deployed pretensioner through normal refuse channels.
27. Wash hands with a mild soap.

DESCRIPTION AND OPERATION

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM DESCRIPTION AND OPERATION

SIR System Overview

The supplemental inflatable restraint (SIR) system supplements the protection offered by the seat belts. The SIR system contains an inflatable restraint sensing and diagnostic module (SDM), air bags, seat belt pretensioners (anchor and retractor), and impact sensors. The SDM determines the severity of a collision with the assistance of impact sensors located at strategic points on the vehicle. When the SDM detects a collision, the SDM will process the information provided by the impact sensors to further support air bag or pretensioner deployment. The SDM will deploy the air bags and pretensioners if it detects a collision of sufficient force. If the force of the impact is not sufficient to warrant air bag deployment, the SDM may still deploy the seat belt pretensioners. The SDM contains a sensing device that converts vehicle velocity changes to an electrical signal. The SDM compares these signals to values stored in memory. If the signals exceed a stored value, the SDM will determine the severity of the impact and either cause current to flow through the frontal deployment loops deploying the frontal air bags and pretensioners, or it will deploy the pretensioners only. The SDM continuously monitors the deployment loops for malfunctions and illuminates the AIR BAG indicator if a fault is detected. The SDM performs continuous diagnostic monitoring of the SIR system electrical components. Upon detection of a circuit malfunction, the SDM will set a DTC and inform the driver by illuminating the AIR BAG indicator. The steering column and knee bolsters are designed to absorb energy and compress during frontal collisions in order to limit leg movement and decrease the chance of injury to the driver and passenger.

AIR BAG Indicator (Driver)

The AIR BAG indicator, located in the instrument cluster, is used to notify the driver of SIR system malfunctions and to verify that the inflatable restraint sensing and diagnostic module (SDM) is communicating with the instrument cluster. When the ignition is turned ON, the SDM is supplied with ignition positive voltage. The instrument cluster will momentarily turn on the AIR BAG indicator. While the indicator is on, the SDM conducts tests on all SIR system components and circuits. If no malfunctions are detected the SDM will communicate with the instrument cluster through the serial data circuit and command the AIR BAG indicator OFF. The SDM provides continuous monitoring of the air bag circuits by conducting a sequence of checks. If a malfunction is detected the SDM will store a diagnostic trouble code (DTC) and command the instrument cluster to illuminate the AIR BAG indicator via serial data. The presence of a SIR system malfunction could result in non-deployment of the air bags or deployment in conditions less severe than intended. The AIR BAG indicator will remain ON until the malfunction has been repaired.

Inflatable Restraint Sensing and Diagnostic Module (SDM)

The inflatable restraint sensing and diagnostic module (SDM) is a microprocessor and the control center for the supplemental inflatable restraint (SIR) system. The SDM contains internal sensors along with external impact sensors, mounted at strategic locations on the vehicle. In the event of a collision, the SDM compares the signals from the internal and external impact sensors to a value stored in memory. When the generated signals exceed the stored value, the SDM will cause current to flow through the appropriate deployment loops to deploy the air bags. The SDM records the SIR system status when a deployment occurs and illuminates the AIR BAG indicator located in the instrument cluster. The SDM performs continuous diagnostic monitoring of the SIR system electrical components and circuitry when the ignition is turned ON. If the SDM detects a malfunction, a DTC will be stored and the SDM will request the instrument cluster to illuminate the AIR BAG indicator, notifying the driver that a malfunction exists. In the event that ignition positive voltage is lost during a collision, the SDM maintains a 23-volt loop reserve for deployment of the air bags. It is important when disabling the SIR system for servicing or rescue operations to allow the 23-volt loop reserve to dissipate, which could take up to 1 minute.

Air Bags

This vehicle may contain up to 10 air bags. The 10 air bags are located in the steering wheel (dual air bags), instrument panel (passenger side) (dual air bags), driver seat side (B-pillar), passenger seat side (B-pillar), left rear seat side, right rear seat side, left roof rail, right roof rail, driver knee (instrument panel), passenger knee (instrument panel). To view the locations of the air bags refer to [Master Electrical Component List](#). Air bags contain a housing, inflatable air bag, two initiating devices (if dual air bag), canister of gas generating material and, in some cases, stored compressed gas. The deployment loops supply current through the air bags to deploy the air bags. The steering wheel and passenger instrument panel air bags have two stages of deployment, which varies the amount of restraint to the occupant according to the collision severity. For moderate frontal collisions the air bags deploy at less than full deployment which consists of stage 1 of the air bag. For more severe frontal collisions a full deployment is initiated which consists of stage 1 and stage 2 of the air bag. The current passing through the air bags ignites the material in the canister producing a rapid generation of gas and in some cases, the release of compressed gas. The gas produced from this reaction rapidly inflates the air bag. Once the air bag is inflated it quickly deflates through the air bag vent holes and/or the bag fabric. Each air bag is equipped with a shorting bar located in the connectors of the air bag. The shorting bar shorts the air bag deployment loop circuitry to prevent unwanted deployment of the air bag when it is disconnected.

Seat Belt Pretensioners (Anchor and Retractor)

The seat belt pretensioners (driver and passenger) consist of a housing, seat belt retractor (located in the B-pillar), seat belt anchor (located on the floor), seat belt webbing, an initiator, and a canister of gas generating materials. To view the locations of the seat belt pretensioners refer to [Master Electrical Component List](#). The initiator is part of the seat belt pretensioner deployment loop. When the vehicle is involved in a collision of sufficient force, the SDM causes current to flow through the seat belt deployment loops to the initiator. Current passing through the initiator ignites the material in the canister producing a rapid generation of gas. The gas produced from this reaction deploys the seat belt pretensioners which removes all of the slack in the seat belts. Depending on the severity of the collision, the seat belt pretensioners may deploy without the frontal air bags deploying, or they will deploy immediately before the frontal air bags deploy. Each seat belt pretensioner is equipped with a shorting bar that is located in the connector of the seat belt pretensioner. The shorting bar shorts the seat belt pretensioner circuitry to prevent unwanted deployment of the seat belt pretensioner when the connector is disconnected.

Impact Sensors

There are multiple impact sensors which may be located in the front of the vehicle, in the front doors or on the B-pillar, and on the C-pillar depending on the vehicle configuration. To view the locations of the impact sensors refer to [Master Electrical Component List](#). The front of vehicle, B-pillar, and C-pillar impact sensors contain a sensing device which monitors vehicle acceleration to detect collisions that are severe enough to warrant air bag deployment. The front door impact sensors contain a sensing device which monitors the door cavity air pressure change to detect side collisions that are severe enough to warrant air bag deployment. It is important when working on components in the door to make sure any items which have a sealing impact on the door (water deflector, exterior door handle, speaker, door harness grommet, or sealing strip) are securely fastened when reinstalled. The impact sensors are not part of the deployment loop, but instead provide input to the Inflatable Restraint Sensing and Diagnostic Module (SDM). The Inflatable Restraint Sensing and Diagnostic Module contains a microprocessor that performs calculations using the measured inputs from acceleration and pressure sensors. When the generated calculations exceed the stored value, the Inflatable Restraint Sensing and Diagnostic Module will cause current to flow through the deployment loops deploying the appropriate air bags.

Passenger Presence Detection System and Air Bag Indicator (Passenger)

NOTE: The passenger presence system (PPS) is a calibrated unit. When replacing the assembly all parts in the service kit must remain together. Do not mix any of the old parts with the new parts. After repairing or replacing the PPS, the preload test must be performed in order to function properly.

The passenger presence detection system (PPS) is used to monitor the type of occupant that is sitting in the front passenger seat and communicate the status to the inflatable restraint sensing and diagnostic module (SDM). The SDM then uses this information to determine whether to enable or suppress the deployment of the passenger instrument panel air bag. The PPS consists of an electronic control module, a sensor mat in the seat, a harness, and PASSENGER AIR BAG ON/OFF indicators. The PPS transmits and receives a low-level electric field. The measured capacitance value of this field is used to determine the type of occupant sitting in the front passenger seat. If the measured capacitance is less than a calibrated value, then the passenger presence module will send a serial data signal to the SDM to disable the passenger instrument panel air bag. If the measured capacitance is greater than a calibrated value, then the passenger presence module will send a serial data signal to the SDM to enable the passenger instrument panel air bag. The SDM will notify the customer of the enable/disable status by illuminating one of the PASSENGER AIR BAG ON/OFF indicator. PPS monitors itself for faults and will displays diagnostic trouble codes (DTCs) onthe scan tool. When a fault is detected, the passenger presence module sends out a message to the SDM. The SDM responds by sending a command message to the IPC to illuminate the AIR BAG indicator.

Seat Belt Indicators

The seat belt indicators are controlled through the inflatable restraint sensing and diagnostic module (SDM). For further information on seat belt indicators refer to [Seat Belt System Description and Operation](#) .

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0176: CONTROL MODULE TEMPERATURE SENSOR HIGH TEMPERATURE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0176 54

Control Module Temperature Sensor High Temperature

Circuit/System Description

The power steering control module monitors the temperature of the Power Steering System. The power steering control module uses voltage, current levels and input from an internal temperature sensor to calculate an estimated system temperature. If the power steering control module detects a high system temperature event is occurring, the amount of assist is decreased to reduce system temperature, in effort to prevent thermal damage to the power steering components.

Conditions for Running the DTC

- Ignition ON, engine Running.
- Power steering system voltage is 9 - 16 V.
- Repetitive steering input applied.

Conditions for Setting the DTC

The power steering control module detects a high system temperature.

Action Taken When the DTC Sets

- DTC C0176 54 is stored in memory.
- Steering assist is reduced.

Conditions for Clearing the DTC

A current DTC will clear on the next malfunction-free ignition cycle.

Diagnostic Aids

- DTC C0176 54 does not indicate that a malfunction has occurred. Rather that the power steering control module had to limit current to the power steering motor to avoid thermal damage to the power steering system components. Discuss with the customer about driving conditions when the steering assist was reduced.
- Ensure that no steering components down stream of the power steering column assembly, such as ball joints, tie rod ends, universal joints, or the steering gear assembly, are mechanically binding.

Circuit/System Verification

1. Verify that the DTC sets outside of the conditions for running and setting. Since most occurrences of this DTC are caused by excessive driver inputs, review with the customer the conditions under which the DTC set.
 - **If the DTC did not set outside of the conditions for running and setting**
 1. Ignition ON.
 2. Operate the vehicle within the conditions that the customer experienced, avoiding excessive inputs, and verify the DTC does not reset.
 - If the DTC is set
 1. Verify that no steering components down stream of the power steering column assembly are mechanically binding. Refer to Increase in Effort While Turning Steering Wheel
 - If steering components are mechanically binding, replace the mechanically binding steering components.
 - If no steering components are mechanically binding, replace the steering gear.
 - If the DTC is not set- 3. All OK.
 - **If the DTC set outside of the conditions for running and setting**
- 2. All OK. The power steering is operating as designed.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement
- Refer to Control Module References for power steering control module replacement, programming and setup.

DTC C0460: STEERING WHEEL ANGLE SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0460 00

Steering Wheel Angle Sensor Malfunction

DTC C0460 4B

Steering Wheel Angle Sensor Calibration Not Learned

DTC C0460 5A

Steering Wheel Angle Sensor Signal Not Plausible

Circuit/System Description

The Electric Belt Drive Rack and Pinion Steering Gear contains the steering wheel angle sensor. The steering wheel angle sensor identifies the position and direction of the steering wheel rotation to calculate the driver intended driving direction. The power steering control module uses the signal to determine the proper amount of steering assist to provide.

Conditions for Running the DTC

The condition for running the DTC will not occur until the initialization phase has been completed. The initialization of the electronic brake control module occurs when the following conditions have been met:

- Ignition voltage is greater than 8 V.
- The initialization happens once each ignition cycle when the vehicle speed is greater than 20 km/h (12 MPH) and the vehicle is driven in a straight line without the brake pedal being applied.

Conditions for Setting the DTC

DTC C0460 00, C0460 5A

- Steering angle signal is not valid.
- Steering angle signal line is open.
- Angle signal cycle time is out of range.
- Angle signal duty is out of range.

DTC C0460 4B

Steering sensor zero position is not set.

Action Taken When the DTC Sets

- DTC C0460 is stored in memory.
- No steering assist.

Conditions for Clearing the DTC

A current DTC will clear on the next malfunction-free ignition cycle.

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to [Electric Belt Drive Rack and Pinion Steering Gear Replacement](#)
- Refer to [Control Module References](#) for control module replacement, programming and setup.

DTC C0475: POWER STEERING MOTOR CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC C0475 00

Power Steering Motor Circuit Malfunction

Circuit/System Description

The power steering control module continuously monitors the voltage and current levels being commanded to the 3-phase steering assist motor. The power steering control module compares the desired and actual current levels to detect malfunctions in the internal power steering assist motor circuits.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the internal power steering assist motor circuits.

Action Taken When the DTC Sets

- The DTC is stored in memory.
- No steering assist.

Conditions for Clearing the DTC

A history DTC will clear after 50 consecutive malfunction free ignition cycles.

Scan Tool Reference

[Control Module References](#) for scan tool information.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC C0475 is not set.
 - **If the DTC C0475 is set**
 1. Program the K43 Power Steering Control Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the K43 Power Steering Control Module.
 - If the DTC does not set
 - 3. All OK.
 - **If the DTC C0475 is not set**
3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for control module programming and setup.

DTC C0545: STEERING WHEEL TORQUE SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC C0545 00

Steering Wheel Torque Sensor

Circuit/System Description

The power steering control module continuously monitors the digital torque sensors torque and index current signals. As the steering wheel is turned and torsional twist is applied to the steering shaft, the steering input and output shafts are monitored via the torque signal circuit and then processed by the power steering control module to calculate the steering torque. The steering wheel torque sensor needs to be calibrated to be fully functional.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the torque sensor circuits.

Action Taken When the DTC Sets

- DTC C0545 is stored in memory.
- The driver information center displays the SERVICE POWER STEERING warning message.
- No Steering assist.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction free ignition cycles.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Verify that DTC C0545 is not set.
 - If the DTC is set

NOTE: Check the torque sensor terminal connections for signs of corrosion or damage.

Replace the steering gear.

- **If the DTC is not set**

2. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Electric Belt Drive Rack and Pinion Steering Gear Replacement](#)
- Refer to [Control Module References](#) for control module replacement, programming and setup.

DTC C055C: STEERING GEAR PERFORMANCE MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C055C 00

Steering Gear Performance Malfunction

Circuit/System Description

The power steering control module continuously verifies the mechanical friction of the steering gear. If the friction is too high the clutch between motor and rack slips and the internal angle is not longer valid.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The DTC is set when the mechanical friction of the steering gear is too high.

Action Taken When the DTC Sets

- DTC C055C is stored in memory.
- No steering assist.

Conditions for Clearing the DTC

A history DTC will clear after 40 consecutive malfunction free ignition cycles.

Diagnostic Aids

Ensure that no steering components down stream of the power steering column assembly, such as ball joints, tie rod ends, universal joints, or the steering gear assembly, are mechanically binding.

[Circuit/System Verification](#)

1. Ignition ON.
2. Verify that DTC C055C is not set.
 - **If the DTC is set**
 1. Verify that no steering components down stream of the power steering column assembly are mechanically binding. Refer to [Increase in Effort While Turning Steering Wheel](#)
 - If steering components are mechanically binding, replace the mechanically binding steering components.
 - If no steering components are mechanically binding, replace the steering gear.
 - **If the DTC is not set**
3. All OK.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Electric Belt Drive Rack and Pinion Steering Gear Replacement](#)
- Refer to [Control Module References](#) for power steering control module replacement, programming and setup.

[DTC C0569: INTERNAL CHECK SUM ERROR/CALIBRATION NOT PROGRAMMED/CONFIGURATION NOT PROGRAMMED](#)

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC C0569 31

Internal Check Sum Error

DTC C0569 42

Calibration Not Programmed

DTC C0569 46

Configuration Not Programmed

Circuit/System Description

The power steering control module continuously monitors the parameters of the steering gear. The power steering control module performs a self-test diagnostic during power-up. The configuration is not complete from supplier.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

Electronic power steering control module configuration is not complete.

Action Taken When the DTC Sets

- DTC C0569 is stored in memory.
- No steering assist.

Conditions for Clearing the DTC

A history DTC will clear after 40 consecutive malfunction free ignition cycles.

[Circuit/System Verification](#)

1. Ignition ON.
2. Verify that DTC C0569 is not set.
 - **If the DTC C0569 is set**
 Replace the steering gear.
 - **If the DTC C0569 is not set**
3. All OK.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Electric Belt Drive Rack and Pinion Steering Gear Replacement](#)
- Refer to [Control Module References](#) for power steering control module replacement, programming and setup.

DTC C056D: ELECTRONIC CONTROL UNIT HARDWARE (POWER STEERING CONTROL MODULE)

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

[DTC Descriptor](#)

DTC C056D

Electronic Control Unit Hardware

For symptom byte information, refer to [Symptom Byte List](#) .

[Circuit/System Description](#)

The internal fault detection is handled inside the power steering control module. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

[Conditions for Running the DTC](#)

The power steering control module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The power steering control module has detected an internal malfunction.

Action Taken When the DTC Sets

The power steering control module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.
- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC C056D is not set.
 - **If DTC C056D is set with symptom byte 19, 38, 3B, 3C, 49, or 5A**
 1. Program the K43 Power Steering Control Module.
 2. Verify the DTC does not set.

- If the DTC sets, replace the K43 Power Steering Control Module.
- If the DTC does not set

3. All OK.

- **If DTC C056D is set with symptom byte 37 or 39**

Replace the K43 Power Steering Control Module

- **If DTC C056D is not set**

3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for control module replacement, programming and setup.

DTC C056E: ELECTRONIC CONTROL UNIT SOFTWARE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC C056E

Electronic Control Unit Software

For symptom byte information, refer to [Symptom Byte List](#) .

Circuit/System Description

After replacement of the power steering control module, the power steering control module must be configured with the proper tuning profile using the service programming system (SPS).

After replacement of the power steering control module, power steering motor, or steering gear, the steering position/torque sensor calibration procedure must be performed.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The device has detected an internal fault.

Actions Taken When DTC Sets

- DTC is stored in memory.
- Reduced or no steering assist.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

2. Verify that DTC C056E is not set.
 - **If the DTC C056E is set**
 1. Program the K43 Power Steering Control Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the K43 Power Steering Control Module.
 - If the DTC does not set
 3. All OK.
 - **If the DTC C056E is not set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for Control Module replacement, programming and setup.

DTC C1436: STEERING WHEEL ANGLE SIGNAL

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC C1436

Steering Wheel Angle Signal

For symptom byte information refer to [Symptom Byte List](#)

Circuit/System Description

The steering wheel angle sensor is integrated into the steering gear assembly. The steering wheel angle sensor identifies the position and direction of the steering wheel rotation.

The electronic brake control module receives high speed serial data inputs from the steering angle sensor identifying the position and direction of the steering wheel rotation. The electronic brake control module utilizes this signal to calculate the driver intended driving direction.

Conditions for Running the DTC

The condition for running the DTC will not occur until the initialization phase has been completed. The initialization of the electronic brake control module occurs when the following conditions have been met:

- Ignition voltage is greater than 8 V
- The initialization happens once each ignition cycle when the vehicle speed is greater than 20 km/h (12 mph) and the vehicle is driven in a straight line without the brake pedal being applied.

Conditions for Setting the DTC

C1436 09

The steering wheel angle sensor signal gradient unplausible.

C1436 0A

The steering wheel angle sensor signal remains constant during turning maneuvers.

C1436 11

The steering wheel angle sensor signal is out of range.

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- A Service StabiliTrak message may displayed on the driver information center.
- A Service Brake Assist message may displayed on the driver information center.
- A Service Power Steering Drive with Care message may displayed on the driver information center.
- The electronic brake control module disables the traction control and the electronic stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- Check and adjust all tires to the stated cold air pressure as identified on the tire placard.
- The car should not pull in either direction causing the steering wheel to be off center while driving in a straight line on a level surface.
- Confirm that all tires are of the proper size and matching brands. If a mis-sized or non-matching brand tire is present, inform the customer that in order for the vehicle stability enhanced system to function normally, tires need to be a uniform size and rolling diameter.
- Inspect the serial data circuits and connections at the power steering control module and the electronic brake control module. They should be free from sources of electromagnetic interference and the connections should be clean and tight.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Ignition ON.
2. With a scan tool check the Power Steering Control Module for any DTCs.

- **If any DTCs are present in the Power Steering Control Module**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) in Power Steering Diagnostic Information and Procedures.

- **If there are no DTCs present in the Power Steering Control Module**

1. With a scan tool check to see if DTCs U0126, U0130, or U0131 are set.

- **If DTCs U0126, U0130, or U0131 are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If DTCs U0126, U0130, and U0130 are not set**

2. With a scan tool check to see if DTCs C0035 - C0050 are set in the Electronic Brake Control Module

- **If DTCs C0035 - C0050 are set in the Electronic Brake Control Module**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If DTCs C0035 - C0050 are not set in the Electronic Brake Control Module**

3. Perform the [Steering Wheel Angle Sensor Centering](#) procedure.

- **If the Steering Angle Sensor Centering procedure corrected the DTC**

Proceed to step 6

- **If the Steering Angle Sensor Centering procedure did not correct the DTC**

4. Replace the Steering Gear Assembly.

- **If steering gear assembly replacement corrected the DTC**

Proceed to step 6

- **If steering gear assembly replacement did not correct the DTC**

5. Replace the Electronic Brake Control module.

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Electric Belt Drive Rack and Pinion Steering Gear Replacement](#)
- Refer to [Control Module References](#) for control module replacement, programming and setup.

SYMPTOMS - POWER STEERING SYSTEM

NOTE: Review the system description and operation in order to familiarize yourself with the system functions. Refer to [Power Steering System Description and Operation \(Belt Drive Electronic Power Steering\)](#).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power steering system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Rattle, Clunk, Pop or Shudder Noise from the Power Steering System](#)

- [Whine or Growl Noise from the Power Steering System](#)
- [Increase in Effort While Turning Steering Wheel](#)
- [Poor Return of Steering Wheel](#)
- [Steering Wheel Surges/Jerks While Turning](#)
- [Steering Wheel Kickback](#)
- [Steering Effort Hard or Too Easy in One or Both Directions](#)

RATTLE, CLUNK, POP OR SHUDDER NOISE FROM THE POWER STEERING SYSTEM

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Steering Wheel and Column</u>
2	Road test the vehicle in order to verify the complaint. It may be necessary to compare to a like vehicle. Is a rattle, clunk, popping, or shudder noise present?	Go to Step 3	System OK
3	Inspect the power steering gear bushings for wear or damage. Are the power steering gear bushings worn or damaged?	Go to Step 9	Go to Step 4
4	Inspect the power steering gear fasteners for looseness. Are the power steering gear fasteners loose?	Go to Step 10	Go to Step 5
5	Inspect the steering linkage inner and outer tie rods for looseness. Refer to: • <u>Steering Linkage Inner Tie Rod Inspection</u> • <u>Steering Linkage Outer Tie Rod Inspection</u> Did you find and correct the condition?	Go to Step 14	Go to Step 6
6	Inspect the front suspension components for damage or wear. Are the front suspension components damaged or worn?	Go to Step 11	Go to Step 7
7	Inspect the intermediate steering shaft for proper installation and loose or missing fasteners. Is the intermediate steering shaft installed incorrectly or are any fasteners loose or missing?	Go to Step 12	Go to Step 8
8	For a popping noise, inspect the steering gear shaft dampener rings by performing the following steps: 1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Rotate the steering wheel until the power steering gear reaches its end of travel. Repeat in both directions. Was a popping noise present near the end of travel in one	Go to Step 13	Go to Step 2

Step	Action	Yes	No
	or both directions?		
9	Replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement . Did you complete the repair?	Go to Step 14	-
10	Install the power steering gear fasteners correctly. Refer to Fastener Specifications . Did you complete the repair?	Go to Step 14	-
11	Replace the damaged or worn front suspension components. Did you complete the repair?	Go to Step 14	-
12	Install the intermediate steering shaft and/or fasteners correctly. Refer to: • Intermediate Steering Shaft Replacement • Fastener Specifications Did you complete the repair?	Go to Step 14	-
13	Replace the steering gear shaft dampener ring(s). Refer to Steering Gear Shaft Dampener Ring Replacement .	Go to Step 14	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

WHINE OR GROWL NOISE FROM THE POWER STEERING SYSTEM

Special Tools

CH-39570 Chassis Ear

Equivalent regional tools: [Special Tools](#)

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System
2	Verify that a whine or growl noise is present. Is a whine or growl noise present?	Go to Step 3	System OK
3	Inspect the power steering gear fasteners for looseness and inspect the power steering gear mounting surface for damage. Are the steering gear fasteners loose and/or the mounting surface damaged?	Go to Step 6	Go to Step 4
4	Inspect the power steering assist motor for a whine or growl noise using the CH-39570 chassis ear. Is the noise present at the power steering assist motor?	Go to Step 7	Go to Step 5

Step	Action	Yes	No
5	Inspect the power steering gear for a whine or growl noise using the CH-39570 chassis ear. Is the noise present at the power steering gear?	Go to Step 7	Go to Step 3
6	If the mounting surface on the power steering gear is NOT damaged then replace the power steering gear fasteners. If the mounting surface on the power steering gear IS damaged then replace the power steering gear AND power steering gear fasteners. Refer to: • Fastener Specifications • Electric Belt Drive Rack and Pinion Steering Gear Replacement Did you complete the repair?	Go to Step 8	-
7	Replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement . Did you complete the repair?	Go to Step 8	-
8	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

INCREASE IN EFFORT WHILE TURNING STEERING WHEEL

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System
2	Verify that there is an increase in effort while turning the steering wheel. Does the system operate normally?	System OK	Go to Step 3
3	Inspect for the following tire related conditions: • Incorrect tire inflation • Improper tire size Refer to Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label . Did you find and correct the condition?	Go to Step 10	Go to Step 4

Step	Action	Yes	No
4	Perform the following steps: 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Inspect the steering linkage outer tie rods for wear or a binding condition. Are the steering linkage outer tie rods worn or binding?	Go to Step 7	Go to Step 5
5	Inspect for a worn or binding intermediate steering shaft. Is the intermediate shaft worn or binding?	Go to Step 8	Go to Step 6
6	Inspect for a worn or binding power steering gear. Is the power steering gear worn or binding?	Go to Step 9	System OK
7	Replace the steering linkage outer tie rod(s). Refer to Steering Linkage Outer Tie Rod Replacement . Did you complete the repair?	Go to Step 10	-
8	Replace the intermediate steering shaft. Refer to Intermediate Steering Shaft Replacement . Did you complete the repair?	Go to Step 10	-
9	Replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement . Did you complete the repair?	Go to Step 10	-
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

POOR RETURN OF STEERING WHEEL

Step	Action	Yes	No
DEFINITION: After completing a turn, extra steering input is required for the steering wheel to return to center.			
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System
2	Verify that poor return of the steering wheel is present. Does the system operate normally?	System OK	Go to Step 3
3	Perform the following steps: 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Lubricate the steering linkage outer tie rods and front suspension ball joints, if applicable. 3. Inspect the front suspension system for worn or damaged components. 4. Repair any worn or damaged front suspension	Go to Step 12	Go to Step 4

Step	Action	Yes	No
	components as necessary. Did you find and correct the condition?		
4	Perform the following steps: 1. Rotate the steering wheel ONE revolution in both directions. 2. Rotate the steering wheel back to the original position. Was the steering wheel abnormally difficult to rotate in either direction?	Go to Step 5	Go to Step 10
5	NOTE: • Once the intermediate steering shaft is disconnected, do NOT rotate the steering wheel more than one complete revolution from center. • Ensure the steering column is locked before connecting the intermediate steering shaft. Perform the following steps: 1. Position the front wheels straight ahead and lock the steering wheel to prevent rotation. 2. Disconnect the intermediate steering shaft from the steering column. 3. Note the position of the steering wheel and rotate the steering wheel ONE complete revolution in both directions. 4. Rotate the steering wheel back to the original	Go to Step 11	Go to Step 6

Step	Action	Yes	No
	position. Was the steering wheel abnormally difficult to rotate in either direction?		
6	Inspect the intermediate steering shaft for wear or a binding condition. Did you find and complete the repair?	Go to Step 12	Go to Step 7
7	Perform the following steps: 1. Remove the front tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 2. Disconnect both steering linkage outer tie rods from the steering knuckles. 3. Use your hands in order to move the steering linkage outer tie rod studs. 4. If abnormally difficult to move, replace the steering linkage outer tie rod(s). Did you find and complete the repair?	Go to Step 12	Go to Step 8
8	Perform the following steps: 1. Turn each steering knuckle and strut assembly inboard and outboard to inspect for binding strut components, ball joints or drive axles. 2. Repair or replace any abnormally stiff or loose components. Did you find and complete the repair?	Go to Step 12	Go to Step 9
9	Perform the following steps: 1. Inspect for binding in the power steering gear. 2. If binding is present, repair or replace the power steering gear. Did you find and complete the repair?	Go to Step 12	Go to Step 10
10	Inspect the wheel alignment and adjust as necessary. Refer to <u>Wheel Alignment Measurement</u> . Did you find and complete the repair?	Go to Step 12	-
11	Perform the following steps: 1. Inspect the steering column for binding. 2. If binding is present, repair or replace the steering column as necessary. Go to Step 12	Go to Step 12	-

Step	Action	Yes	No
	Did you find and complete the repair?		
12	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

STEERING WHEEL SURGES/JERKS WHILE TURNING

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System
2	Verify that the steering wheel surges/jerks while turning. Does the system operate normally?	System OK	Go to Step 3
3	Inspect for worn or binding front suspension components. Did you find and correct the condition?	Go to Step 14	Go to Step 4
4	Perform the following steps: 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Inspect the steering linkage outer tie rods for wear or a binding condition. Are the steering linkage outer tie rods worn or binding?	Go to Step 10	Go to Step 5
5	Inspect for a worn or binding intermediate steering shaft. Is the intermediate shaft worn or binding?	Go to Step 11	Go to Step 6
6	Inspect for a worn or binding power steering gear. Is the power steering gear worn or binding?	Go to Step 12	Go to Step 7
7	Check for a worn or binding steering column. Is the steering column worn or binding?	Go to Step 13	Go to Step 8
8	Check for excessive heat in the power steering assist motor. Does the power steering assist motor appear to be overheated?	Go to Step 9	Go to Step 12
9	NOTE: • Do NOT perform excessive parking lot maneuvers during testing. • Excessive parking lot maneuvers can cause the power	Go to Step 14	Go to Step 12

Step	Action	Yes	No
	steering assist motor to heat up. Allow the power steering assist motor to cool and retest the system. Did you correct the condition?		
10	Replace the steering linkage outer tie rod(s). Refer to Steering Linkage Outer Tie Rod Replacement. Did you complete the repair?	Go to Step 14	-
11	Replace the intermediate steering shaft. Refer to Intermediate Steering Shaft Replacement. Did you complete the repair?	Go to Step 14	-
12	Replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement. Did you complete the repair?	Go to Step 14	-
13	Replace the steering column. Refer to Steering Column Replacement. Did you complete the repair?	Go to Step 14	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

STEERING WHEEL KICKBACK

Condition	Action
The steering column mounting fasteners are loose.	Tighten the steering column mounting fasteners to specification. Refer to Steering Column Replacement.
The power steering gear mounting fasteners are loose.	Tighten the power steering gear mounting fasteners to specification. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement.
The steering linkage inner and/or outer tie rods are loose or damaged.	Inspect the steering linkage inner and outer tie rods. Refer to: • Steering Linkage Inner Tie Rod Inspection • Steering Linkage Outer Tie Rod Inspection

STEERING EFFORT HARD OR TOO EASY IN ONE OR BOTH DIRECTIONS

Condition	Action
The battery power is low.	Ensure proper battery voltage.

Condition	Action
One or both of the steering column dash seals are binding.	Adjust or replace the steering column dash seal(s). Refer to: • Steering Column Dash Inner Seal Replacement • Steering Column Dash Outer Seal Replacement
The intermediate steering shaft joints and/or fasteners are loose, worn or binding.	Tighten or replace the intermediate steering shaft joints and/or fasteners. Refer to Intermediate Steering Shaft Replacement .
The power steering gear is binding.	Replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement .
The steering column shaft is bent.	Replace the steering column. Refer to Steering Column Replacement .
The connectors to the power steering assist motor are damaged or disconnected.	Perform the following steps: 1. Verify the connectors are properly connected. 2. Verify the connectors are not damaged. 3. If the connectors are damaged, replace the connectors.
The power steering gear sensor wire is damaged.	Replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement .
The power steering control module is malfunctioning.	Confirm the DTC and replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement .
The power steering assist motor shaft is binding.	Confirm the DTC and replace the power steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement .

REPAIR INSTRUCTIONS

WIRE TO WIRE REPAIR - STEERING

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool (non GMNA)
- **J-38125-5A** Ultra Torch Special Tool
- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or

component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

NOTE: If the wiring harness internal to the transmission is damaged, the wiring harness must be replaced. The use of splice sleeves in an attempt to repair the internal transmission wires, connectors, or terminals could result in performance issues.

NOTE: Do not splice wires in Door Harness Grommets.

NOTE: The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides the necessary low resistance contact integrity for these sensitive, low energy circuits.

Use only DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Selection

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm ² / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19300089	Red (1) or Red/Green (1)	Red (2)	0.22 - 0.8/(18 - 26)
Blue 19168447	Blue (2)	Blue (3)	1.0 - 2.0/(14 - 16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0 - 5.0/(10 - 12)

NOTE: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:
 - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
 - Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
 - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:

- When adding a length of wire to the existing harness, use the same size wire as the original wire.
 - Perform one of the following items in order to find the correct wire size:
 - Find the wire on the schematic and convert to regional wiring gauge size.
 - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
 - Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
 - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
 - If the wire is damaged, repeat this procedure after removing the damaged section.
4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

Fig. 2: Splice Sleeve Crimping Tool With 4 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used

for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

Fig. 3: Splice Sleeve Crimping Tool With 3 Crimp Nests
Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

Fig. 4: Identifying DuraSeal Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

Fig. 5: Crimped DuraSeal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [Folded-Over Wire Repair](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

Fig. 6: Heated Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

12. Using the heat torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Weatherpack™ Wiring Repair

NOTE: Some replacement pigtail connectors may be delivered without the terminated leads installed into the connector. For Weatherpack™ connectors, all terminated leads included in the package should to be installed into the connector. If the connector end view shows that a terminal is not occupied, the extra terminated lead(s) need to be installed and the end(s) sealed using a DuraSeal splice sleeve and taped back into the harness.

1. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [**Folded-Over Wire Repair**](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different

gauges.

Fig. 7: Tightly Close Handles Of Crimp Tool
Courtesy of GENERAL MOTORS COMPANY

2. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Holding the DuraSeal with one hand gently tug on the wire to ensure it is crimped in the DuraSeal.

3. Using the heat torch, apply heat to the crimped area of the barrel.

Fig. 8: Heat To Crimped Area Of Barrel

Courtesy of GENERAL MOTORS COMPANY

4. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Fig. 9: Taping Extra Terminated Leads Back Into Harness
Courtesy of GENERAL MOTORS COMPANY

5. Tape the extra terminated lead(s) back into the harness.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the heat torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

CONNECTOR RECONNECTION - STEERING

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Loose, corroded, or painted terminal stud/fastener
- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- A terminal not seated all the way into the connector body
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect

component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center. Use the **EL-35616** kit to test for proper terminal contact. Failure to use the **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter into the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is

present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Power Distribution Schematics](#) .

- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point (screw or stud). Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underhood/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.
 - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition components, motors, generator etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.
- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#) .
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a

clamping diode.

- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

STEERING LINKAGE INNER TIE ROD INSPECTION

Special Tools

GE-8001 Dial Indicator Set

For equivalent regional tools, refer to [Special Tools](#).

NOTE: **This inspection procedure does not supersede local government required inspections that have more stringent requirements.**

1. Turn the ignition key to the ON position with the engine OFF.

Fig. 10: Measuring Lash Between Inner Tie Rod And Steering Gear Housing
Courtesy of GENERAL MOTORS COMPANY

2. With the aid of an assistant, turn the steering wheel to the full stop position and hold the steering wheel in that position until the test is complete. Part of the steering linkage inner tie rod (2) being tested should be inside the steering gear housing. The inner tie rod housing (1) being tested should be inside the steering gear housing and seated against the steering stop.
3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
4. If there is not a good location for the **GE-8001** dial indicator pointer at the steering gear housing, install a large

worm gear hose clamp (3) to the steering gear housing over the larger steering gear boot clamp and align the clamp so that the screw can be a location for the **GE-8001** dial indicator pointer.

5. Install the **GE-8001** dial indicator between the inner tie rod and the steering gear housing or the worm gear clamp in such a way as to measure the lash between the inner tie rod and the steering gear housing. The lash between the inner tie rod and the steering gear housing is equal to the lash between the inner tie rod and the inner tie rod housing because the inner tie rod housing is inside the steering gear housing during this procedure.

Fig. 11: Identifying Tire Grasping Positions

Courtesy of GENERAL MOTORS COMPANY

NOTE: Only move the tire enough to feel any lash between the inner tie rod and the inner tie rod housing without moving the steering gear rack.

6. Grasping the tire at the 3 o'clock (2) and 9 o'clock (1) positions, gently push in on one side of the tire in order to remove any lash.
7. Zero the **GE-8001** dial indicator.
8. On the same side of the tire previously pushed in, gently pull out and measure the lash.
9. Record the measurement shown on the **GE-8001** dial indicator.
10. If the measured value exceeds 0.5 mm (0.02 in), replace the inner tie rod. Refer to [Steering Linkage Inner Tie Rod Replacement](#).

11. Repeat the procedure for the other side.

STEERING LINKAGE OUTER TIE ROD INSPECTION

Special Tools

GE-8001 Dial Indicator Set

For equivalent regional tools, refer to [Special Tools](#).

NOTE: This inspection procedure does not supersede local government required inspections that have more stringent requirements.

1. Inspect the outer tie rod seal. If the outer tie rod seal is torn, replace the outer tie rod. Refer to [Steering Linkage Outer Tie Rod Replacement](#).
2. Raise the side of the vehicle being inspected with a floor jack while maintaining contact between the opposite wheel and the shop floor. Support the lower control arm with a floor jack stand as far outboard as possible and remove the floor jack. Refer to [Lifting and Jacking the Vehicle](#).

Fig. 12: Measuring Outer Tie Rod Lash
Courtesy of GENERAL MOTORS COMPANY

3. Install the **GE-8001** dial indicator between the outer tie rod and the steering knuckle as shown in the graphic.

Note that the tire and wheel assembly is shown removed only for clarification of the **GE-8001** dial indicator position.

Fig. 13: Identifying Tire Grasping Positions
Courtesy of GENERAL MOTORS COMPANY

4. Grasping the tire at the 3 o'clock (2) and 9 o'clock (1) positions, gently push in on one side of the tire to remove any lash.
5. Zero the **GE-8001** dial indicator.
6. On the same side of the tire previously pushed inwards, gently pull outwards and measure the lash.
7. Record the measurement shown on the **GE-8001** dial indicator.
8. If the measured value exceeds 0.5 mm (0.02 in), replace the outer tie rod. Refer to [Steering Linkage Outer Tie Rod Replacement](#).
9. Repeat the procedure for the other side.

STEERING LINKAGE OUTER TIE ROD REPLACEMENT

Fig. 14: Steering Linkage Outer Tie Rod
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the front tire and wheel assembly. Refer to Tire and Wheel Removal and Installation	
1	Steering Linkage Inner Tie Rod Nut Procedure Place match marks on the steering linkage inner tie rod nut and the steering linkage inner tie rod. NOTE: Do NOT tighten the steering linkage inner tie rod nut during installation. Tighten the nut after adjusting the front toe.

Callout	Component Name
2	Steering Linkage Outer Tie Rod Nut CAUTION: Refer to Fastener Caution . Procedure Use the EN-45059 meter to tighten the steering linkage outer tie rod nut. Tighten First Pass: 35 N.m (26 lb ft) Final Pass: (30 - 45 degrees) Special Tools EN-45059 Torque Angle Meter Equivalent regional tools: Special Tools
3	Steering Linkage Outer Tie Rod CAUTION: Do not free the ball stud by using a pickle fork or a wedge-type tool. Damage to the seal or bushing may result. Procedure 1. Use the CH-24319-B puller to separate the steering linkage outer tie rod from the steering knuckle. 2. Clean the tapered surface of the steering knuckle. 3. Inspect the steering linkage inner tie rod for bent or damaged threads. If necessary, replace the steering linkage inner tie rod. Refer to Steering Linkage Inner Tie Rod Replacement 4. Measure and adjust the front toe. Refer to Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment 5. Calibrate the power steering control module. Refer to Power Steering Control Module Calibration Special Tools CH-24319-B Universal Steering Linkage and Tie Rod Puller Equivalent regional tools: Special Tools

STEERING GEAR BOOT REPLACEMENT

Fig. 15: Steering Gear Boot

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Steering Linkage Outer Tie Rod. Refer to Steering Linkage Outer Tie Rod Replacement	
1	Steering Linkage Inner Tie Rod Nut Procedure Place match marks on the steering linkage inner tie rod nut and the steering linkage inner tie rod.
2	Steering Gear Boot Outer Clamp
3	Steering Gear Boot Inner Clamp Procedure 1. Cut the steering gear boot inner clamp. DISCARD the clamp. 2. Use the CH-22610 pliers to install the NEW steering gear boot inner clamp. NOTE: Position the NEW steering gear boot inner clamp on the steering gear boot

Callout	Component Name
	before installing the boot on the steering gear. Special Tools CH-22610 Keystone Clamp Pliers Equivalent regional tools: Special Tools
4	Steering Gear Boot Procedure 1. After removing the steering gear boot, inspect the steering linkage inner tie rod for evidence of corrosion or contamination. If corrosion or contamination is evident, replace the steering gear. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement 2. Install the steering gear boot and ensure the boot is seated in the assembly groove of the steering gear before installing the steering gear boot clamps.

STEERING GEAR SHAFT DAMPENER RING REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove the steering gear outer and inner boot clamps and slide the steering gear boot onto the steering linkage inner tie rod. Refer to [Steering Gear Boot Replacement](#)

DISCARD the steering gear boot inner clamp.

3. Separate Steering Linkage Inner Tie Rod @ Steering Gear. Refer to [Steering Linkage Inner Tie Rod Replacement](#)
4. Turn the front wheels all the way opposite of the side being serviced.

Fig. 16: Steering Gear Shaft Dampener Ring
Courtesy of GENERAL MOTORS COMPANY

5. Use a small pick tool to grasp the steering gear shaft dampener ring (1) inside the steering gear housing.

Fig. 17: Steering Gear Shaft Dampener Ring
Courtesy of GENERAL MOTORS COMPANY

6. Remove the steering gear shaft dampener ring (1) from the steering gear housing.

DISCARD the ring.

Installation Procedure

Fig. 18: Steering Gear Shaft Dampener Ring
Courtesy of GENERAL MOTORS COMPANY

NOTE: After the steering linkage inner tie rod and steering gear boot are installed, rotate the front tires all the way to the side being serviced to finish seating the steering gear shaft dampener ring.

1. Position the NEW steering gear shaft dampener ring (1) in the steering gear housing.

Push the seal in as far as it will go by hand.

NOTE: The NEW steering gear boot inner clamp **MUST** be positioned on the steering gear boot while the steering linkage inner tie rod is disconnected from the steering gear.

2. Install Steering Linkage Inner Tie Rod @ Steering Gear. Refer to [Steering Linkage Inner Tie Rod Replacement](#)
3. Slide the steering gear boot into place on the steering gear and install the steering gear boot inner and outer clamps. Refer to [Steering Gear Boot Replacement](#)

Use a NEW steering gear boot inner clamp.

4. Measure and adjust the front toe. Refer to [Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment](#)

ELECTRIC BELT DRIVE RACK AND PINION STEERING GEAR REPLACEMENT

Special Tools

EN-45059 Torque Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

CAUTION: During removal and installation, all EPS components including mechanical and/or electrical is extremely susceptible to damage. Dropping or prying on any EPS component may cause internal damage. If damage occurs or a part is dropped, the

EPS component must be replaced.

CAUTION: Care must be taken during removal and installation of the Electronic Power Steering (EPS) components to not hit or break the EPS motor/controller module or module harness connectors. If the EPS motor/controller module or module connectors are damaged, the complete component must be replaced.

Fig. 19: Drivetrain And Front Suspension Cradle
Courtesy of GENERAL MOTORS COMPANY

1. Remove Drivetrain and Front Suspension Cradle (1). Refer to [Drivetrain and Front Suspension Cradle Replacement](#)

Fig. 20: Front Stabilizer Shaft And Insulator Clamp Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Remove Front Stabilizer Shaft Insulator Clamp Bolts (1) (Qty: 4)

DISCARD the bolts.
3. Remove the front stabilizer shaft (2) from the drivetrain and front suspension cradle.

Fig. 21: Steering Gear, Nuts, Washers And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove Steering Gear Nuts (1) (Qty: 3)
5. Remove Steering Gear Washers (2) (Qty: 3)
6. Remove Steering Gear Bolts (3) (Qty: 3)

DISCARD the bolts.

7. Remove the steering gear (4) from the drivetrain and front suspension cradle.
8. Transfer components as necessary.

Installation Procedure

Fig. 22: Steering Gear, Nuts, Washers And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Position the steering gear (4) on the drivetrain and front suspension cradle.

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a **NEW** torque-to-yield or single use fastener when installing this component.

Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

2. Install NEW Steering Gear Bolts (3) (Qty: 3)

Install NEW bolts.

3. Install Steering Gear Washers (2) (Qty: 3)
4. Install Steering Gear Nuts (1) (Qty: 3)

CAUTION: Refer to [Fastener Caution](#) .

5. Use the **EN-45059** meter to tighten the steering gear bolts (3) to:

Tighten

1. First Pass: 55 N.m (41 lb ft)
2. Final Pass: (150 - 165 degrees)

Fig. 23: Front Stabilizer Shaft And Insulator Clamp Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Position the front stabilizer shaft (2) on the drivetrain and front suspension cradle.
7. Install NEW Front Stabilizer Shaft Insulator Clamp Bolts (1) (Qty: 4). Refer to [Stabilizer Shaft Replacement](#)

Fig. 24: Drivetrain And Front Suspension Cradle

Courtesy of GENERAL MOTORS COMPANY

8. Install Drivetrain and Front Suspension Cradle (1). Refer to [Drivetrain and Front Suspension Cradle Replacement](#)
9. Program the power steering control module. Refer to [Control Module References](#)
10. Measure and adjust the wheel alignment. Refer to [Wheel Alignment Measurement](#)
11. Calibrate the power steering control module. Refer to [Power Steering Control Module Calibration](#)

STEERING LINKAGE INNER TIE ROD REPLACEMENT

Fig. 25: Steering Linkage Inner Tie Rod

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Steering Gear Boot. Refer to Steering Gear Boot Replacement	
1	Steering Linkage Inner Tie Rod CAUTION: Refer to Component Fastener Tightening Caution . CAUTION: Do not change the steering gear preload adjustment before moving the inner tie rod from the steering gear. Changing the steering gear preload adjustment before moving the inner tie rod could result in damage to the pinion and the steering gear. Procedure 1. Place an appropriate size crow foot wrench or equivalent on the flats of the steering linkage inner tie rod housing. 2. Rotate the inner tie rod housing counterclockwise to remove the inner tie rod and clockwise to install the inner tie rod. 3. Measure and adjust the front toe. Refer to Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment 4. Calibrate the power steering control module. Refer to Power Steering Control Module Calibration

POWER STEERING CONTROL MODULE CALIBRATION

Steering Angle Sensor Centering and Software Endstop Learning

WARNING: An inaccurate or not centered steering angle sensor could limit the operation of the electric power steering and may result in personal injury.

Centering of the steering angle sensor and software endstop learning might be required after certain service procedures are performed. Some of these procedures are as follows:

- Steering angle sensor replacement
- Steering gear replacement
- Power steering assist motor replacement
- Steering column replacement
- Steering linkage inner tie rod replacement
- Steering linkage outer tie rod replacement

Internal Steering Angle Sensor Centering

The centering procedure of the internal steering angle sensor can be completed with the following steps:

Conditions: Front axle measured and set, engine running, vehicle speed 0 km/h (0 MPH), internal steering angle sensor is activated.

1. Using the steering wheel, align the front wheels in the center forward position.
2. Using a scan tool, perform the Configuration/Reset Functions, Steering Wheel Angle Sensor Centering procedure.
3. Steer from the center position slowly 90° to the left.
4. Steer slowly back to the center position and then slowly 90° to the right.
5. Steer slowly back to the center position.
6. Perform the steering movements again.
7. Centering procedure is completed.

Software Endstop Learning

The software endstop learning procedure is completed during the Steering Wheel Angle Sensor Centering procedure above.

DESCRIPTION AND OPERATION

POWER STEERING SYSTEM DESCRIPTION AND OPERATION (BELT DRIVE ELECTRONIC POWER STEERING)

Fig. 26: Electric Power Steering System Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K43	K43 Power Steering Control Module
K17	K17 Electronic Brake Control Module
P16	P16 Instrument Cluster
B137	B137 Power Steering Shaft Torque Sensor
M38	M38 Power Steering Motor

The belt driven electronic power steering system consists of the following components:

- The integrated electromechanical power steering unit, containing the power steering control module, its sensors, the power steering motor, a belt drive and a ball nut mechanism
- The Electric Belt Drive Rack and Pinion Steering Gear containing the steering angle sensor and power steering shaft torque sensor

The belt driven electric power steering system reduces the amount of effort needed to steer the vehicle utilizing the power steering control module to control the power steering motor to maneuver the steering gear. The power steering control module also uses a combination of the torque sensor, motor rotational sensor, battery voltage circuit and GMLAN serial data circuit to perform the system functions. The power steering control module monitors vehicle speed and engine speed from the engine control module via the GMLAN serial data circuit to determine the amount of steering assist needed to steer the vehicle. At low speeds more assist is provided for easy turning during parking maneuvers. At higher speeds less assist is provided for improved road feel and directional stability.

The power steering control module uses a combination of the torque sensor, motor rotational sensor, vehicle speed, and calculated system temperature inputs to determine the amount of assist needed. The power steering control module continuously monitors the digital torque sensor's torque and index current signals. As the steering wheel is

turned and torsional twist is applied to the steering shaft, the steering input and output shafts are monitored via the torque signal circuit and then processed by the power steering control module to calculate the steering torque. The voltage signals of the motor position sensor and the digital torque sensor's index current signal are both processed by the power steering control module to detect and calculate the steering wheel angle.

The power steering control module responds to the change in the digital torque sensor signals as well as the motor rotational sensor's voltage signals by commanding current to the power steering motor. The power steering control module controls the motor drive circuit to drive the alternating current motor. The power steering control module & motor assembly is attached to the base of the steering gear housing and applies power assist directly to the rack with a belt drive and a ball nut mechanism to maneuver the rack laterally depending on the direction the steering wheel is turned.

The power steering control module has the ability to calculate an internal system temperature to protect the power steering system from damage caused by high temperature. To reduce a high system temperature, the power steering control module will reduce the amount of current commanded to the power steering motor, which reduces the amount of steering assist. The power steering control module has the ability to detect malfunctions within the electric power steering system. Any malfunction detected that disables steering assist will cause the SERVICE POWER STEERING message to be displayed on the driver information center.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - STEERING WHEEL AND COLUMN

Review the system description and operation in order to familiarize yourself with the system functions. Refer to [Steering Wheel and Column Description and Operation](#).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel and column.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Steering Column Tilt Function Inoperative](#)
- [Noise in Steering Column](#)
- [Looseness in Steering Column](#)

HEATED STEERING WHEEL INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Switch Signal	2	1	-	-
Indicator Dimming Control 2	3	3	-	-
Heated Steering Wheel Switch LED Control	4	3	3	-
Switch Ground	-	1	-	-
Module Ground	-	1	-	-
1. Heated Steering Wheel System Inoperative 2. Heated Steering Wheel Always ON 3. LED Inoperative 4. LED Always ON				

Circuit/System Description

The Steering Wheel Heating Control Module controls the heated steering wheel and the heated steering wheel ON indicator based on an input from the heated steering wheel switch. When the heated steering wheel switch is pressed, the switch signal circuit is pulled to ground. This indicates to the heating steering wheel control module that steering wheel heat is requested. When the request is seen, the heated steering module supplies voltage to the indicator lamp and supplies voltage to the heating elements, which are internal to the steering wheel.

Circuit/System Verification

1. Ignition ON.
2. Verify the S70L Steering Wheel Controls Switch - Left is OFF. The steering wheel heater indicator should not be illuminated and the left and right sides of the steering wheel should not be warm.

- **The steering wheel is always warm**

Refer to [Heated Steering Wheel Malfunction](#)

- **The steering wheel does not become warm and the heater indicator is illuminated**

Refer to Circuit/System Testing

- **The steering wheel does not become warm and the heater indicator is not illuminated**

3. Press and release the S70L Steering Wheel Controls Switch - Left. The steering wheel heater indicator should illuminate and the left and right sides of the steering wheel should become warm.

- **The steering wheel does not become warm**

Refer to [Heated Steering Wheel Malfunction](#)

- **The steering wheel becomes warm and the heater indicator does not illuminate**

Refer to Circuit/System Testing

- **The steering wheel becomes warm and the heater indicator illuminates**

4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 in-line harness connector at the K32 Heated Steering Wheel Control Module.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.

- **If 10 Ω or greater**

1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition ON.

4. Verify a test lamp illuminates between the ignition voltage circuit terminal 9 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF, remove the test lamp.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse. Refer to [Power Mode Mismatch](#).
- If 2 Ω or greater

3. Verify the in-line fuse is OK and there is voltage at the fuse.

- If the in-line fuse is blown, replace the K32 Steering Wheel Heating Control Module.
- If the in-line fuse is OK, repair the open/high resistance in the circuit.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.

2. Test for infinite resistance between the ignition voltage circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K32 Steering Wheel Heating Control Module.

- **If the test lamp illuminates**

5. Ignition OFF, connect the X2 in-line harness connector. Disconnect the harness connector at the S70L Steering Wheel Control Switch - Left. Ignition ON.

6. Verify a test lamp illuminates between the signal voltage circuit terminal 4 and ground.

- **If the test lamp does not illuminate**

1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Control Switch - Right.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the S70R Steering Wheel Control Switch - Right.

- **If the test lamp illuminates**

7. Ignition ON.

8. Test for less than 1 V between the control circuit terminal 7 and ground.

- **If greater than 1 V**

1. Disconnect the K32 Steering Wheel Heating Control Module harness connector.

2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - If greater than 1 V, repair the short to voltage on the circuit.
 - If less than 1 V
3. Replace the K32 Steering Wheel Heating Control Module.
 - **If infinite resistance**
9. Ignition OFF.
10. Test for infinite resistance between the control circuit terminal 7 and ground.
 - **If less than infinite resistance**
 1. Disconnect the K32 Steering Wheel Heating Control Module harness connector.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Replace the K32 Steering Wheel Heating Control Module.
 - **If infinite resistance**
11. Install a 3 A fused jumper wire between the ground circuit terminal 7 and ground. Ignition ON.
12. Verify the steering wheel heat indicator is illuminated.
 - **If the steering wheel heat indicator does not illuminate**
 1. Disconnect the K32 Steering Wheel Heating Control Module harness connector.
 2. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - Replace the S70L Steering Wheel Control Switch - Left
 - **If the steering wheel heat indicator illuminates**
13. Replace the K32 Steering Wheel Heating Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair

- Refer to [Cruise Control Switch Replacement](#)
- Refer to [Control Module References](#) for control module replacement, programming and setup

Heater Element Ground	-	3	-	-
Module Ground	-	1	-	-
1. Heated Steering Wheel System Inoperative 2. Heated Steering Wheel Always ON 3. Heated Steering Wheel Inoperative				

Circuit/System Description

The heated steering wheel control module controls the heated steering wheel and the heated steering wheel ON indicator based on an input from the heated steering wheel switch. When the heated steering wheel switch is pressed, the switch signal circuit is pulled to ground. This indicates to the heating steering wheel control module that steering wheel heat is requested. When the request is seen, the heated steering wheel control module supplies voltage to the indicator lamp and supplies voltage to the heating elements, which are internal to the steering wheel.

Diagnostic Aids

- Before replacing the steering wheel for complaints of not getting hot enough, a reliable infrared temperature gun should be used to measure the temperature at various points around the rim. The steering wheel's normal operating temperature is 32°C (89.6°F) and takes approximately 10 min to reach that temperature. It may take up to 20 min for the normal operating temperature to stabilize within the steering wheel rim. There may be spike in temperature during the first 3 - 4 min before it stabilizes at normal operating temperature. The steering wheel will take longer to heat up if the vehicle temperature is below -21°C (-5.8°F). The steering wheel heater will not operate when the steering wheel temperature is above 32°C (89.6°F).

Fig. 2: Steering Wheel Rim Infrared Measurement Point
Courtesy of GENERAL MOTORS COMPANY

- The infrared measurements are made at the rim (1) at the 3 and 9 o'clock positions of the steering wheel.

Fig. 3: Temperature Measurements Should Not Be Made On Face

Courtesy of GENERAL MOTORS COMPANY

- The wood sections and the stitching are not heated. Temperature measurements should not be made on the face (1) to insure accurate temperature readings.

- [Wiring Repairs](#)

Circuit/System Verification

Using an Infrared Temperature Gun

1. Engine running, all accessories OFF.
2. Verify the steering wheel heater switch is OFF and the steering wheel heater indicator should not be illuminated.
 - **If the heater indicator is illuminated**

Refer to [Heated Steering Wheel Indicator Malfunction](#)

- **If the heater indicator is not illuminated**

Fig. 4: Steering Wheel Rim Infrared Measurement Point

Courtesy of GENERAL MOTORS COMPANY

NOTE: The Infrared Temperature Gun should be within 50.8 mm (2 in) and parallel to the steering wheel rim when taking temperature readings.

3. Measure the temperature readings at the 3 and 9 o'clock positions on the steering wheel rim (1).
4. Verify that the steering wheel temperature is 25°C (77°F) or below.

- **If the steering wheel temperature is greater than 25°C (77°F)**

Allow the steering wheel to cool before proceeding to next step.

- **If the steering wheel temperature is 25°C (77°F) or below**

5. Press and release the steering wheel heater switch. The steering wheel heater indicator should illuminate. Allow the steering wheel to heat for a minimum of 10 min so that the temperature stabilizes.

- **If the heater indicator does not illuminate**

Refer to [Heated Steering Wheel Indicator Malfunction](#)

- If the heater indicator illuminates

Fig. 5: Steering Wheel Rim Infrared Measurement Point

Courtesy of GENERAL MOTORS COMPANY

NOTE: The Infrared Temperature Gun should be within 50.8 mm (2 in) and parallel to the steering wheel rim when taking temperature readings.

6. Measure the temperature readings at the 3 and 9 o'clock positions on the steering wheel rim (1).
7. Verify that the steering wheel temperature is greater than 28°C (82.4°F) within 20 min.
 - If after 20 minutes the measured temperature is less than 28°C (82.4°F)

Refer to Circuit System Testing.

- If after 20 minutes the measured temperature is 28°C (82.4°F) or greater

8. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 in-line harness connector at the K32 Heated Steering Wheel Control Module.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
 - **If 10 Ω or greater**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition voltage circuit terminal 9 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 Ω in the ignition circuit end to end.
 - If less than 2 Ω , verify the fuse is OK and there is voltage at the fuse. Refer to [Power Mode Mismatch](#).
 - If 2 Ω or greater
 3. Verify the in-line fuse is OK and there is voltage at the fuse.
 - If the in-line fuse is blown, replace the K32 Steering Wheel Heating Control Module.
 - If the in-line fuse is OK, repair the open/high resistance in the circuit.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K32 Steering Wheel Heating Control Module.
 - **If the test lamp illuminates**
5. Ignition OFF, connect the in-line harness connector X2. Disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left.
6. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
 - **If 10 Ω or greater**
 1. Ignition OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
7. Ignition ON.
8. Test for B+ between the signal circuit terminal 8 and ground.
 - **If less than B+**
 1. Ignition OFF, disconnect the in-line harness connector at the S70L Steering Wheel Controls Switch

- Left.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K32 Steering Wheel Heating Control Module.

• **If B+**

9. Ignition OFF, disconnect the harness connector at the K32 Heated Steering Wheel Control Module.

10. Ignition ON.

11. Test for less than 1 V between the signal circuit terminal 1 and ground.

• **If greater than 1 V**

Repair the short to voltage on the circuit.

• **If less than 1 V**

12. Ignition OFF, connect the harness connector at the K32 Heated Steering Wheel Control Module.

13. Place the S70L Steering Wheel Controls Switch - Left in the OFF position.

14. Test for infinite resistance between terminal 8 and terminal 1 at the S70L Steering Wheel Controls Switch - Left.

• **If less than infinite resistance**

Replace the S70L Steering Wheel Controls Switch - Left.

• **If infinite resistance**

15. Place the S70L Steering Wheel Controls Switch - Left in the ON position.

16. Test for less than 40 Ω between terminal 8 and terminal 1.

• **If 40 Ω or greater**

Replace the S70L Steering Wheel Controls Switch - Left

• **If less than 40 Ω**

17. Disconnect the in-line harness connector at the E15 Steering Wheel Heater.

18. Test for less than 10 Ω between the ground circuit terminal 4 at the K32 Steering Wheel Heating Control Module and ground.

• **If 10 Ω or greater**

Repair the open/high resistance in the circuit.

• **If less than 10 Ω**

19. Test for 1.5 - 3.0 Ω between the signal terminal 3 and the ground terminal 4 at the E15 Steering Wheel Heater.

• **If not within the specified range**

Replace the E15 Steering Wheel Heater.

- **If within the specified range**

20. Test for 9 - 11k Ω between the control circuit terminal 2 and the ground terminal 1 on the E15 Steering Wheel Heater.

- **If not within the specified range**

Replace the E15 Steering Wheel Heater.

- **If within the specified range**

21. Replace the K32 Steering Wheel Heating Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Cruise Control Switch Replacement](#)
- Refer to [Steering Wheel Replacement](#)
- Refer to [Control Module References](#) for control module replacement, programming and setup.

STEERING COLUMN TILT FUNCTION INOPERATIVE

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Steering Wheel and Column
2	Verify that the steering column tilt function is inoperative. Does the steering column tilt function operate normally?	System OK	Go to Step 3
3	If equipped, verify that the following components are not seized or corroded: • Tilt pivot pins • Tilt head lock shoes Are the components seized or corroded?	Go to Step 7	Go to Step 4
4	Inspect the tilt pivot pins for binding. Are the tilt pivot pins binding?	Go to Step 8	Go to Step 5
5	Inspect for a weak or broken steering column tilt spring. Is the steering column tilt spring weak or broken?	Go to Step 9	Go to Step 6
6	Inspect the steering column wiring harness routing for tightness. Was the steering column wiring harness routed correctly?	Go to Step 11	Go to Step 10

Step	Action	Yes	No
7	Replace the steering column. Refer to Steering Column Replacement . Did you complete the repair?	Go to Step 11	-
8	If serviceable, replace the pivot pins. If not serviceable replace the steering column. Refer to Steering Column Replacement . Did you complete the repair?	Go to Step 11	-
9	If serviceable, replace the tilt spring. Did you complete the repair?	Go to Step 11	-
10	Route the steering column wiring harness to the correct location. Did you correctly route the wiring harness?	Go to Step 11	-
11	Operate the steering column tilt function in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

NOISE IN STEERING COLUMN

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Steering Wheel and Column
2	Verify that noise is present in the steering column during operation. Is noise present in the steering column during operation?	Go to Step 3	System OK
3	Inspect the steering column mounting features for the following conditions: • The steering column mounting fasteners are loose. • The steering column mounting features are sheared. Are the steering column mounting features loose or sheared?	Go to Step 10	Go to Step 4
4	Inspect the SIR/SRS coil for noise. Is the SIR/SRS coil noisy?	Go to Step 11	Go to Step 5
5	If equipped, inspect the lock plate retaining ring for correct installation. Is the lock plate retaining ring installed incorrectly?	Go to Step 12	Go to Step 6
6	Inspect the steering column upper and lower bearings for the following conditions:	Go to Step 13	Go to Step 7

Step	Action	Yes	No
	• Damage • Lubrication • Wear • Proper seating Are the bearings in need of repair or replacement?		
7	Does the steering column tilt joint need to be lubricated?	Go to Step 14	Go to Step 8
8	NOTE: Inspect the intermediate steering shaft for noise while driving the vehicle, turning the steering wheel, and applying the brakes. Inspect the intermediate steering shaft for noise. Is the intermediate steering shaft noisy?	Go to Step 15	Go to Step 9
9	NOTE: For vehicles equipped with a telescoping steering column, perform this step. If not equipped, go to next step. Inspect the steering column for noise while telescoping the column. Is the steering column noisy while telescoping?	Go to Step 16	Go to Step 17
10	NOTE: If the steering column mounting	Go to Step 17	-

Step	Action	Yes	No
	features are damaged or sheared, replace the steering column. Refer to Steering Column Replacement. Tighten the steering column mounting fasteners to specification. Refer to Fastener Specifications. Did you complete the repair?		
11	Replace the SIR/SRS coil. Refer to Steering Wheel Airbag Coil Replacement. Did you complete the repair?	Go to Step 17	-
12	Install the lock plate retaining ring correctly. Did you complete the repair?	Go to Step 17	-
13	NOTE: If the steering column upper and/or lower bearings are not serviceable, replace the steering column. Refer to Steering Column Replacement. Replace the steering column upper and/or lower bearings, if serviceable. Did you complete the replacement?	Go to Step 17	-
14	Lubricate the steering column tilt joint. Did you complete the repair?	Go to Step 17	-
15	Replace the appropriate intermediate steering shaft component. Did you complete the repair?	Go to Step 17	-

Step	Action	Yes	No
16	Redistribute or add lubricant to the steering column lower jacket with the column telescoped to its end of outward travel. Did you complete the repair?	Go to Step 17	-
17	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

LOOSENESS IN STEERING COLUMN

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Steering Wheel and Column
2	Verify that the steering column is loose. Is the steering column loose?	Go to Step 3	System OK
3	Inspect the steering column mounting features for the following conditions. - The steering column mounting fasteners are loose. - The steering column mounting features are sheared. Are the steering column mounting features loose or sheared?	Go to Step 5	Go to Step 4
4	Inspect the upper and/or lower bearings for looseness. Are any of the bearings worn or loose?	Go to Step 6	Go to Step 7
5	NOTE: If the steering column mounting features are damaged or sheared, replace the steering column. Refer to Steering Column Replacement. Tighten the steering column mounting fasteners to specification. Refer to Fastener Specifications. Did you	Go to Step 7	-

Step	Action	Yes	No
	complete the repair?		
6	NOTE: If the steering column upper and/or lower bearings are not serviceable, replace the steering column. Refer to Steering Column Replacement. Replace the upper and/or lower bearings, if serviceable. Did you complete the repair?	Go to Step 7	-
7	Operate the steering column in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

NOTE: If the wiring harness internal to the transmission is damaged, the wiring

harness must be replaced. The use of splice sleeves in an attempt to repair the internal transmission wires, connectors, or terminals could result in performance issues.

NOTE: Do not splice wires in Door Harness Grommets.

NOTE: The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides the necessary low resistance contact integrity for these sensitive, low energy circuits.

Use only DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Selection

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm ² / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19300089	Red (1) or Red/Green (1)	Red (2)	0.22 - 0.8/(18 - 26)
Blue 19168447	Blue (2)	Blue (3)	1.0 - 2.0/(14 - 16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0 - 5.0/(10 - 12)

NOTE: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:
 - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
 - Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
 - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:
 - When adding a length of wire to the existing harness, use the same size wire as the original wire.

- Perform one of the following items in order to find the correct wire size:
 - Find the wire on the schematic and convert to regional wiring gauge size.
 - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
 - Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
 - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
 - If the wire is damaged, repeat this procedure after removing the damaged section.
4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
 5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

Fig. 6: Splice Sleeve Crimping Tool With 4 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge

wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

Fig. 7: Splice Sleeve Crimping Tool With 3 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

Fig. 8: Identifying DuraSeal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

Fig. 9: Crimped DuraSeal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to **Folded-Over Wire Repair** for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

Fig. 10: Heated Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

12. Using the heat torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Weatherpack™ Wiring Repair

NOTE: Some replacement pigtail connectors may be delivered without the terminated leads installed into the connector. For Weatherpack™ connectors, all terminated leads included in the package should to be installed into the connector. If the connector end view shows that a terminal is not occupied, the extra terminated lead(s) need to be installed and the end(s) sealed using a DuraSeal splice sleeve and taped back into the harness.

1. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [Folded-Over Wire Repair](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.

Fig. 11: Tightly Close Handles Of Crimp Tool
Courtesy of GENERAL MOTORS COMPANY

2. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Holding the DuraSeal with one hand gently tug on the wire to ensure it is crimped in the DuraSeal.

3. Using the heat torch, apply heat to the crimped area of the barrel.

Fig. 12: Heat To Crimped Area Of Barrel

Courtesy of GENERAL MOTORS COMPANY

4. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Fig. 13: Taping Extra Terminated Leads Back Into Harness

Courtesy of GENERAL MOTORS COMPANY

5. Tape the extra terminated lead(s) back into the harness.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the heat torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

CONNECTOR RECONNECTION - STEERING

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#).

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Loose, corroded, or painted terminal stud/fastener
- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- A terminal not seated all the way into the connector body
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease/lubricant (Nyogel

760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center. Use the **EL-35616** kit to test for proper terminal contact. Failure to use the **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter into the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Power Distribution Schematics](#) .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point (screw or stud). Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underhood/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.
 - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition

components, motors, generator etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.

- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#) .
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

INTERMEDIATE STEERING SHAFT REPLACEMENT

Fig. 14: Intermediate Steering Shaft

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in	

Callout	Component Name
position before disconnecting the following components: • The steering column • The intermediate shaft(s) • The steering gear After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil. Preliminary Procedures 1. With the front wheels in the straight ahead position, pull the driver's seat belt between the spokes on the steering wheel and buckle the seat belt to secure the steering wheel. 2. Place match marks on the steering gear shaft and the intermediate steering shaft to aid in installation. 3. Place match marks on the steering column shaft and the intermediate steering shaft to aid in installation.	

STEERING COLUMN UPPER TRIM COVER REPLACEMENT

Fig. 15: Steering Column Upper Trim Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
NOTE: The instrument panel cluster trim plate and the steering column upper trim cover must be removed as an assembly, do not attempt to separate. Preliminary Procedure 1. Disable SIR system. Refer to SIR Disabling and Enabling 2. Remove Instrument Panel Trim Plate Applique - Left Side. Refer to Instrument Panel Trim Plate	

Callout	Component Name
<u>Applique Replacement - Left Side</u> 3. Remove Instrument Panel Center Air Outlet. Refer to <u>Instrument Panel Center Air Outlet Replacement</u>	
1	Instrument Panel Cluster Trim Plate Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (22 lb in)
2	Instrument Panel Cluster Trim Plate Procedure 1. Use a flat bladed plastic trim tool. 2. Grasp the instrument panel cluster trim plate and steering column upper trim cover assembly and pull rearward releasing the clips securing the assembly to the instrument panel. 3. Disconnect the electrical connector.
3	Steering Column Upper Trim Cover Procedure 1. Turn the steering wheel to the left in order to release the left tab securing the upper trim cover to the lower trim cover. 2. Release the retainers along the left side of the upper trim cover securing it to the lower trim cover. 3. While holding the left side of the trim cover up, turn the steering wheel enough to release the right retainer tab securing the right side of the upper trim cover to the lower trim cover. 4. Release the retainers along the right side of the upper trim cover securing it to the lower trim cover. 5. Transfer components as necessary. 6. When replacing either the instrument panel cluster trim plate or the steering column upper trim cover snap the two pieces together prior to installing them into the vehicle.

STEERING COLUMN LOWER TRIM COVER REPLACEMENT

Fig. 16: Steering Column Lower Trim Cover
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Loosen Steering Column Upper Trim Cover. Refer to Steering Column Upper Trim Cover Replacement	
1	Instrument Panel Steering Column Lower Trim Cover Bolt (Qty: 3) CAUTION: Refer to Fastener Caution . Procedure Rotate the steering wheel left and right to access the fasteners securing the lower trim cover to the turn signal switch bracket. Tighten 2.5 N.m (22 lb in)
2	Steering Column Lower Trim Cover Procedure Extend the steering column to the fully telescoped position.

TURN SIGNAL SWITCH REPLACEMENT

Fig. 17: Turn Signal Switch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Steering Column Lower Trim Cover. Refer to Steering Column Lower Trim Cover Replacement 2. Reposition the steering column upper trim cover as necessary.	
1	Turn Signal Switch Procedure 1. Disconnect the electrical connector. 2. Release the retaining tabs and remove the turn signal switch from the turn signal switch bracket.

TURN SIGNAL SWITCH BRACKET REPLACEMENT

Fig. 18: Turn Signal Switch Bracket
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Steering Wheel Airbag Coil. Refer to Steering Wheel Airbag Coil Replacement 2. Remove Turn Signal Switch. Refer to Turn Signal Switch Replacement 3. Remove Windshield Wiper and Washer Switch. Refer to Windshield Wiper and Washer Switch Replacement	
1	Turn Signal Switch Bracket Procedure Release the retaining tabs and remove the turn signal switch bracket from the steering column.

STEERING WHEEL PAD ACCESSORY WIRING HARNESS REPLACEMENT

Fig. 19: Steering Wheel Pad Accessory Wiring Harness

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the left side lower steering wheel radio control switch. Refer to Radio Control Switch Replacement - Steering Wheel (Left Side Lower) 2. Remove the left side rear steering wheel radio control switch. Refer to Radio Control Switch Replacement - Steering Wheel (Left Side Rear) 3. Remove the right side rear steering wheel radio control switch. Refer to Radio Control Switch Replacement - Steering Wheel (Right Side Rear)	
1	Steering Wheel Pad Accessory Wiring Harness Procedure 1. Disconnect the electrical connectors. 2. Remove the steering wheel pad accessory wiring harness from the steering wheel.

STEERING WHEEL REPLACEMENT

Fig. 20: Steering Wheel
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Refer to SIR Warning . WARNING: Refer to SIR Inflator Module Handling and Storage Warning . Preliminary Procedures 1. Disable SIR system. Refer to SIR Disabling and Enabling 2. Remove Steering Wheel Airbag. Refer to Steering Wheel Airbag Replacement	
1	Steering Wheel Bolt CAUTION:

Callout	Component Name
	Refer to <u>Fastener</u> <u>Caution</u> . Procedure 1. Clean the threads of the bolt with denatured alcohol or equivalent and allow to dry. 2. Apply thread locking adhesive to the bolt. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u> Tighten 45 N.m (33 lb ft)
2	Steering Wheel Procedure 1. Disconnect the electrical connectors. 2. Install the steering wheel bolt until 2 to 3 threads are engaged. 3. Wiggle the steering wheel until the wheel disengages completely. 4. Remove Steering Wheel Bolt 5. Remove Steering Wheel 6. Transfer components as necessary.

STEERING WHEEL SPOKE COVER REPLACEMENT

Fig. 21: Steering Wheel Spoke Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Steering Wheel Airbag. Refer to Steering Wheel Airbag Replacement	
1	Steering Wheel Spoke Cover Fastener (Qty: 4) CAUTION: Refer to Fastener Caution . Tighten 1.5 N.m (13 lb in)
2	Steering Wheel Spoke Cover Procedure 1. Use the appropriate trim tool to release the steering wheel switches from the steering wheel. 2. Disconnect the electrical connectors. 3. Transfer components as necessary.

STEERING COLUMN REPLACEMENT

Removal Procedure

WARNING: Refer to [SIR Warning](#) .

WARNING: Refer to [SIR Inflator Module Handling and Storage Warning](#) .

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#)
2. With the vehicle in accessory mode, remove fuse to unlock the steering column lock control module. Refer to [Steering Wheel Schematics](#)

Fig. 22: Instrument Panel Knee Bolster

Courtesy of GENERAL MOTORS COMPANY

3. Remove Instrument Panel Knee Bolster (1). Refer to [Instrument Panel Knee Bolster Replacement](#)

Fig. 23: Instrument Panel Lower Airbag - Driver Side

Courtesy of GENERAL MOTORS COMPANY

4. Remove Instrument Panel Lower Airbag - Driver Side (1). Refer to [Instrument Panel Lower Airbag Replacement - Driver Side](#)

Fig. 24: Floor Front Air Outlet Duct - Left Side
Courtesy of GENERAL MOTORS COMPANY

5. Remove Floor Front Air Outlet Duct - Left Side (1). Refer to [Floor Front Air Outlet Duct Replacement - Left Side](#)

Fig. 25: Steering Column Lower Trim Cover
Courtesy of GENERAL MOTORS COMPANY

NOTE: Reposition the steering column upper trim cover as necessary.

6. Remove Steering Column Lower Trim Cover (1). Refer to [Steering Column Lower Trim Cover Replacement](#)

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap

to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

7. With the steering wheel in the straight ahead position, LOCK the steering column.

Fig. 26: Intermediate Steering Shaft

Courtesy of GENERAL MOTORS COMPANY

NOTE: Place match marks on the steering column shaft and the intermediate steering shaft to aid in installation.

8. Separate Intermediate Steering Shaft (1) @ Steering Column. Refer to [Intermediate Steering Shaft Replacement](#)
9. Disconnect the steering column electrical connectors as necessary.

Fig. 27: Steering Column Nuts

Courtesy of GENERAL MOTORS COMPANY

10. Remove Steering Column Nuts (1) (Qty: 4)

Fig. 28: Steering Column

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Once the steering column is removed from the vehicle, the column is extremely susceptible to damage. Dropping the column assembly on the end could collapse the steering shaft or loosen the plastic injections, which maintain column rigidity. Leaning on the column assembly could cause the jacket to bend or deform. Any of the above damage could impair the columns collapsible design. Do NOT hammer on the end of the shaft, because hammering could loosen the plastic injections, which maintain

column rigidity. If you need to remove the steering wheel, refer to the Steering Wheel Replacement procedure in this section.

11. Remove the steering column (1) from the vehicle.
12. If replacing the steering column, transfer components as necessary.
13. If replacing the steering column, copy the match marks from the OLD steering column to the NEW steering column.

Installation Procedure

Fig. 29: Steering Column

Courtesy of GENERAL MOTORS COMPANY

1. Position the steering column (1) on the vehicle.

Fig. 30: Steering Column Nuts With Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

2. Install and tighten Steering Column Nuts (1) (Qty: 4) in sequence to 22 N.m (16 lb ft)
3. Connect the steering column electrical connectors.

Fig. 31: Intermediate Steering Shaft

Courtesy of GENERAL MOTORS COMPANY

4. Install Intermediate Steering Shaft (1) @ Steering Column. Refer to [Intermediate Steering Shaft Replacement](#)

Fig. 32: Steering Column Lower Trim Cover

Courtesy of GENERAL MOTORS COMPANY

5. Install Steering Column Lower Trim Cover (1). Refer to [Steering Column Lower Trim Cover Replacement](#)

Fig. 33: Floor Front Air Outlet Duct - Left Side

Courtesy of GENERAL MOTORS COMPANY

6. Install Floor Front Air Outlet Duct - Left Side (1). Refer to [Floor Front Air Outlet Duct Replacement - Left Side](#)

Fig. 34: Instrument Panel Lower Airbag - Driver Side

Courtesy of GENERAL MOTORS COMPANY

7. Install Instrument Panel Lower Airbag - Driver Side (1). Refer to [Instrument Panel Lower Airbag Replacement - Driver Side](#)

Fig. 35: Instrument Panel Knee Bolster

Courtesy of GENERAL MOTORS COMPANY

8. Install Instrument Panel Knee Bolster (1). Refer to [Instrument Panel Knee Bolster Replacement](#)
9. Install the steering column lock control module fuse.
10. Program the steering column lock control module. Refer to [Control Module References](#)
11. Center the steering angle sensor. Refer to [Steering Wheel Angle Sensor Centering](#)

STEERING COLUMN DASH INNER SEAL REPLACEMENT

Fig. 36: Steering Column Dash Inner Seal

Callout	Component Name
Preliminary Procedure Separate Intermediate Steering Shaft @ Steering Gear. Refer to Intermediate Steering Shaft Replacement	
1	Steering Column Dash Inner Seal Procedure 1. To remove the steering column dash inner seal, lift the edge of the seal and release the plastic retaining tabs from the steering gear input shaft. 2. To install the steering column dash inner seal, push the seal until the plastic retaining tabs engage the steering gear input shaft.

STEERING COLUMN DASH OUTER SEAL REPLACEMENT

Removal Procedure

Fig. 37: Drivetrain And Front Suspension Cradle

Courtesy of GENERAL MOTORS COMPANY

1. Remove Drivetrain and Front Suspension Cradle (1). Refer to [Drivetrain and Front Suspension Cradle Replacement](#)

Fig. 38: Steering Column Dash Outer Seal

Courtesy of GENERAL MOTORS COMPANY

2. Remove the steering column dash outer seal (1) from the steering gear.

Installation Procedure

Fig. 39: Steering Column Dash Outer Seal

Courtesy of GENERAL MOTORS COMPANY

NOTE: Align the slot in the steering column dash outer seal with the raised section on the steering gear.

1. Install the steering column dash outer seal (1) on the steering gear.

Fig. 40: Drivetrain And Front Suspension Cradle

Courtesy of GENERAL MOTORS COMPANY

2. Install Drivetrain and Front Suspension Cradle (1). Refer to [Drivetrain and Front Suspension Cradle Replacement](#)

DESCRIPTION AND OPERATION

STEERING WHEEL AND COLUMN DESCRIPTION AND OPERATION

The steering wheel and column has 4 primary functions:

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

Vehicle Steering

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

The steering column can be adjusted vertically and longitudinally

Vehicle Security

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch
- The steering column lock
- The ignition cylinder

- The theft deterrent immobilizer module, if equipped

Driver Convenience

The steering wheel and column may also have driver controls attached for convenience and comfort. The following controls may be mounted on the steering wheel or column.

- The turn signal switch
- The headlamp dimmer switch
- The wiper/washer switch
- The horn pad
- The redundant radio/entertainment system controls
- The tilt functions
- The telephone system controls
- The DIC controls
- The cruise control functions
- The automatic transmission manual setting function

Driver Safety

The steering wheel and column has safety features to protect the driver. The following components may be mounted on or near the steering column:

Energy-Absorbing Steering Column: The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The energy-absorbing feature, collapsible steering shaft, and break away mounting features help reduce the injury in the event of an accident.

1. Remove Drivetrain and Front Suspension Cradle (1) **Drivetrain and Front Suspension Cradle Replacement**

Fig. 2: Front Stabilizer Shaft And Insulator Clamp Bolts

Courtesy of GENERAL MOTORS COMPANY

2. Remove Front Stabilizer Shaft Insulator Clamp Bolt (1)

DISCARD the bolts.

3. Remove the front stabilizer shaft (2) from the drivetrain and front suspension cradle.

Installation Procedure

Fig. 3: Front Stabilizer Shaft And Insulator Clamp Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Position the front stabilizer shaft (2) on the drivetrain and front suspension cradle.

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

2. Install Front Stabilizer Shaft Insulator Clamp Bolt (1)

Install NEW bolts.

CAUTION: Refer to [Fastener Caution](#) .

3. Use the **EN-45059** meter to tighten the front stabilizer shaft insulator clamp bolts (1).

Tighten

1. First Pass: 22 N.m (16 lb ft)
2. Final Pass: (30 - 45 degrees)

WHEEL STUD REPLACEMENT

Special Tools

CH-43631 Ball Joint Separator

Equivalent regional tools: **Special Tools**

Removal Procedure

1. Remove Front Wheel Bearing and Hub Assembly **Front Wheel Bearing and Hub Replacement**

Fig. 39: Separator And Wheel Stud

Courtesy of GENERAL MOTORS COMPANY

2. Use the **CH-43631** separator (1) to remove the wheel stud (2) from the flange on the hub assembly.
- DISCARD the stud.

Installation Procedure

Fig. 40: Wheel Stud, Flat Washers And Wheel Nut

Courtesy of GENERAL MOTORS COMPANY

1. Position the NEW wheel stud (1) in the flange on the hub assembly.
2. Install flat washers (2) and an OLD wheel nut (3) on the wheel stud.
3. Use a suitable tool to prevent the flange on the hub assembly from rotating.
4. Tighten the wheel nut until the wheel stud is firmly seated.
5. Remove the wheel nut and flat washers.
6. Install Front Wheel Bearing and Hub Assembly [Front Wheel Bearing and Hub Replacement](#)

STRUT AND SHOCK ABSORBER INSPECTION

NOTE: The strut assembly **DOES NOT** have to be removed from the vehicle to perform the following inspection procedure.

NOTE: A light film of oil on the top portion of the strut is normal. **DO NOT** replace the strut for this condition.

Fig. 41: Strut and Shock Absorber Inspection
Courtesy of GENERAL MOTORS COMPANY

Condition 1

Oil or fluid residue only on the bottom of the strut tube or on other strut components and not originating from the shaft seal, is not a strut related problem. **DO NOT** replace the strut, look for other external leaks.

Condition 2

Light film/residue on the strut tube, but not on the spring seat and originating from the shaft seal, is a **NORMAL** condition. **DO NOT** replace the strut.

Condition 3

Oil drip or trail down the strut tube and originating from the shaft seal, is an **ABNORMAL** condition. Replace the strut.

Condition 4

Extreme wet film of oil covering the strut tube and pooling in the spring seat and originating from the shaft seal, is an ABNORMAL condition. Replace the strut.

Inspection

1. Verify the customer's concern is present. If the concern is present, continue to the next step. If the concern is not present, then the vehicle is operating normally.

NOTE: **The strut assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

2. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
3. Visually inspect each of the shock absorbers or struts for external fluid leaks. Refer to the following conditions 1, 2, 3, and 4 for visual inspection.
 - If conditions 1 or 2 are found, continue to step 4.
 - If conditions 3 or 4 are found, replace strut. Refer to Strut Replacement.
4. If equipped with electronic suspension control system, ensure that the system is working properly. Refer to Diagnostic Starting Point-Electronic Suspension Control.
5. Use your hands in order to lift up and push down on each corner of the vehicle 3 times. Remove your hands from the vehicle. If the corner motion exceeds 2 cycles, replace the strut. If the strut does not exceed 2 cycles, NO repair is necessary.

STRUT ASSEMBLY REMOVAL AND INSTALLATION

Special Tools

EN-45059 Torque Angle Meter

Equivalent regional tools: [Special Tools](#)

8. Remove Front Suspension Strut Mount Bolt (1)

DISCARD the bolts.

NOTE:

- If the front strut assembly has been replaced previously, a third front suspension strut mount bolt may be present instead of a front suspension strut mount nut.
- If a third front suspension strut mount bolt is present, DISCARD the bolt along with the other two front suspension strut mount bolts as in the previous removal step.

9. Remove Front Suspension Strut Mount Nut (2)

DISCARD the nut.

Fig. 47: Front Suspension Strut Assembly
Courtesy of GENERAL MOTORS COMPANY

10. Remove the front suspension strut assembly (1) from the vehicle.

Fig. 48: Front Suspension Strut Mount Stud
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- The front suspension strut assembly comes from the factory with a stud in one of the front suspension strut mount holes that is used in the factory to align the assembly. The stud is torque-to-yield and should NOT be reused.
- When reinstalling the front suspension strut assembly, engineering recommends removing the stud from the front suspension strut mount and replacing it with a third bolt. The bolt is the same part number as the other two mount bolts.

11. Remove Front Suspension Strut Mount Stud

DISCARD the stud.

Installation Procedure

Fig. 49: Front Suspension Strut Assembly

Courtesy of GENERAL MOTORS COMPANY

1. Position the front suspension strut assembly (1) on the vehicle.

Fig. 50: Front Suspension Strut Mount Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

2. Install Front Suspension Strut Mount Bolt (1)

Install NEW bolts.

CAUTION: Refer to [Fastener Caution](#) .

3. Use the **EN-45059** meter to tighten the front suspension strut mount bolts.(1)

SUSPENSION STRUT DISPOSAL

Fig. 55: Drilling Hole In Strut At Center Of End Cap
Courtesy of GENERAL MOTORS COMPANY

WARNING: Use the proper eye protection when drilling to prevent metal chips from causing physical injury.

- 1. Clamp the strut in a vise horizontally with the rod (1) completely extended.
- 2. Drill a hole in the strut at the center of the end cap (3) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the strut. Use shop towels in order to contain the escaping oil.
- 3. Remove the strut from the vise.
- 4. Hold the strut over a drain pan vertically with the hole down.
- 5. Move the rod (1) in and out of the tube (2) to completely drain the oil from the strut.

STRUT, STRUT COMPONENT, OR SPRING REPLACEMENT

DESCRIPTION AND OPERATION

FRONT SUSPENSION DESCRIPTION AND OPERATION

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tires travelling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system. The suspension system must allow for the vertical movement of the tire and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tire's horizontal relationship to the road.

This requires that the steering knuckle be suspended between a lower control arm and a strut assembly. The lower control arm attaches from the steering knuckle at the outermost point of the control arm. The attachment is through a ball and socket type joint. The innermost end of the control arm attached at 2 points to the vehicle frame through semi-rigid bushings. The upper portion of the steering knuckle is attached to a strut assembly. The strut assembly then connects to the vehicle body by way of an upper bearing. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the steering knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension over the strut assembly. A strut is used in conjunction with this system in order to dampen out the oscillations of the coil spring. A strut is a basic hydraulic cylinder. The strut is filled with oil and has a moveable shaft that connects to a piston inside the strut. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone. The

lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface.

Front suspensions systems utilize a stabilizer shaft. The stabilizer bar connects between the left and right lower control arm assemblies through the stabilizer link and stabilizer shaft insulators. This bar controls the amount of independent movement of the suspension when the vehicle turns. Limiting the independent movement defines the vehicles handling characteristics on turns.

SPECIAL TOOLS AND EQUIPMENT

SPECIAL TOOLS

Illustration	Tool Number/ Description
	CH-6066 KM-6066 Holder

Illustration	Tool Number/ Description
 The illustration shows a mechanical spring tensioner tool on the left, consisting of a long handle with a threaded end and a sliding block. To the right of the tool are six dental arches, three upper and three lower, arranged in two columns of three. Each arch has a series of small rectangular tabs or notches along its inner curve, which are designed to engage with the spring tensioner tool for adjustment.	CH-6068 MKM-6068 Spring Tensioner

15. Remove Rear Axle Bracket Bolt (2) and DISCARD

16. Remove Rear Axle Bracket (1)

Installation Procedure

Fig. 15: Rear Axle Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: The Rear Axle Bracket (1) is equipped with a pin to arrange the rear axle on the vehicle. The pin has to be insert into the vehicle.

1. Install Rear Axle Bracket (1)

NOTE: Install, but do NOT tighten

2. Install New Rear Axle Bracket Bolt (2)

NOTE: A second technician is required.

3. Position the rear axle to the vehicle.

Fig. 16: Right Side Axle Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

WARNING: Torque-to-Yield Fastener Warning

CAUTION: Fastener Caution

4. Install Rear Axle Bracket Bolt (1) @Body and tighten the NEW bolt.

1. First Pass: 100 N.m (74 lb ft)

2. Final Pass: 30 - 45 degrees

Fig. 17: Measuring Vertical Distance

Courtesy of GENERAL MOTORS COMPANY

5. Raise the rear axle to the proper trim height specification by measuring the vertical distance (A) between the upper and lower insulator seat.
 - Adjust (A) to: **152 mm (5.98 in)**

Fig. 18: Rear Axle Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

WARNING: **Torque-to-Yield Fastener Warning**

6. Tighten the bolts.(2)
 1. First Pass: 100 N.m (74 lb ft)

2. Final Pass:30 - 45 degrees

NOTE: Tighten the bolts with vehicle standing on the ground.

19. Rear Shock Absorber Bolt (1) - Tighten [Shock Absorber Replacement](#)

STRUT AND SHOCK ABSORBER INSPECTION

NOTE: The shock absorber assembly DOES NOT have to be removed from the vehicle

to perform the following inspection procedure.

NOTE: A light film of oil on the top portion of the lower shock absorber tube is normal. DO NOT replace the shock absorber for this condition.

Fig. 25: Identifying Shock Absorber Conditions

Courtesy of GENERAL MOTORS COMPANY

Condition 1

Oil or fluid residue only on the bottom or top of the shock absorber and not originating from the shaft seal, is not a shock absorber related problem. DO NOT replace the shock absorber, look for other external leaks.

Condition 2

Light film/residue on approximately 1/3 (a) or less of the lower shock tube (A) and originating from the shaft seal, is a NORMAL condition. DO NOT replace the shock absorber.

Condition 3

Oil drip or trail down the lower shock tube and originating from the shaft seal, is an ABNORMAL condition. Replace the shock absorber. Refer to [Shock Absorber Replacement](#).

Condition 4

An extreme wet film of oil covering more than 1/3 (b) of the lower shock tube (B) and originating from the shaft seal, is an ABNORMAL condition. Replace the shock absorber. Refer to [Shock Absorber Replacement](#).

Inspection

- 1. Verify the customer's concern is present. If the concern is present, continue to the next step. If the concern is not present, then the vehicle is operating normally.

NOTE: **The shock absorber assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

- 2. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
- 3. Visually inspect each of the shock absorbers for external fluid leaks. Refer to the following conditions 1, 2, 3 and 4 for visual inspection.
 - If conditions 1 or 2 are found, continue to step 4.
 - If conditions 3 or 4 are found, replace shock absorber. Refer to [Shock Absorber Replacement](#).
- 4. Use your hands in order to lift up and push down on each corner of the vehicle 3 times. Remove your hands from the vehicle. If the corner motion exceeds 2 cycles, replace the shock absorber. If the shock absorber does not exceed 2 cycles, NO repair is necessary.

SHOCK ABSORBER DISPOSAL

Fig. 35: Drilling Hole In Shock Absorber At Centerpunched Locations

Courtesy of GENERAL MOTORS COMPANY

WARNING: Gas charged shock absorbers contain high pressure gas. Do not remove the snap ring from inside the top of the tube. If the snap ring is removed, the contents of the shock absorber will come out with extreme force which may result in personal injury.

WARNING: To prevent personal injury, wear safety glasses when centerpunching and drilling the shock absorber. Use care not to puncture the shock absorber tube with the centerpunch.

1. Make an indentation 10 mm (0.4 in) from the bottom (4) of the tube (3) using a centerpunch.
2. Clamp the shock absorber in a vise horizontally with the shock absorber rod (1) completely extended.
3. Drill a hole in the shock absorber at the centerpunch (4) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the shock absorber. Use shop towels in order to contain the escaping oil.
4. Make an indentation in the middle (2) of the tube (3) with a centerpunch.
5. Drill a second hole in the shock absorber at the centerpunch (2) using a 5 mm (3/16 in) drill bit. Oil will exhaust when the drill bit penetrates the shock absorber. Use shop towels in order to contain the escaping oil.
6. Remove the shock absorber from the vise. Hold the shock absorber over a drain pan horizontally with the holes down. Move the rod (1) in and out of the tube (3) to completely drain the oil from the shock absorber.

WHEEL STUD REPLACEMENT

Fig. 64: Wheel Stud

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation . 3. Remove the rear brake rotor. Refer to Rear Brake Rotor Replacement	
1	Wheel Stud (Qty: 5) Procedure 1. Rotate the wheel hub to gain enough worker area to remove the wheel stud. 2. Using the CH 43631 remover, remove and discard the wheel stud from the wheel hub. Replace with new only. 3. When installing the wheel stud, use the proper amount of washers to allow the wheel stud to be fully seated against the wheel hub flange. 4. Use a wheel nut with the flat side of the wheel nut facing the washers to fully seat the wheel stud. Special Tools CH 43631 Ball Joint Remover For equivalent regional tools, refer to Special Tools.

DESCRIPTION AND OPERATION

REAR SUSPENSION DESCRIPTION AND OPERATION

This vehicle has a semi-independent twist-beam rear suspension system consisting of the following components:

- An axle with integral trailing arms
- A "V" shaped twisting cross beam
- Two coil springs
- Two shock absorbers

Axle Assembly

The axle assembly attaches to the underbody through a rubber bushing and bracket located at the front of each integral trailing arm. The brackets are bolted to the underbody side rails. The axle structure itself maintains the geometrical relationship of the wheels relative to the centerline of the body.

All	P215/50R17	687 mm (27.05 in)	700 mm (27.56 in)	21 mm (0.83 in)	255 mm (10.04 in)

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - SUSPENSION GENERAL DIAGNOSIS

IMPORTANT: The following step must be completed before using the symptom tables.

Review the system description and operation in order to familiarize yourself with the system functions. Refer to the appropriate description and operation:

- [Front Suspension Description and Operation](#) for the front suspension
- [Rear Suspension Description and Operation](#) for the rear suspension
- [General Description](#) for tires and wheels

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of any of the suspension subsystems.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for proper tire size and inflation pressure. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Ride Diagnosis](#)
- [Vehicle Leads/Pulls](#)
- [Suspension Bottoms](#)
- [Torque Steer](#)
- [Memory Steer](#)

RIDE DIAGNOSIS

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
2	NOTE: Verify the vehicle suspension package RPO. Verify that the ride is too soft or too hard. Does the vehicle ride normally?	System OK	Go to Step 3
3	Check the tire inflation and adjust to specifications. Refer to Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label . Did you adjust the tire pressure?	Go to Step 6	Go to Step 4
4	Inspect the vehicle trim height. Refer to Trim Height Inspection. Did you find and correct the condition?	Go to Step 6	Go to Step 5
5	Inspect the following suspension components for wear or damage: - Shock Absorbers - Refer to Strut and Shock Absorber Inspection , for front and Strut and Shock Absorber Inspection for rear. - Springs Did you find and correct the condition?	Go to Step 6	-
6	Drive the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

VEHICLE LEADS/PULLS

Step	Action	Yes	No
DEFINITION: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path.			
1	Did you review the General Description and perform the visual/physical inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
2	Road test the vehicle in order to verify the complaint. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect the tire/wheel assemblies for the following conditions:	Go to Step 9	Go to Step 4

Step	Action	Yes	No
	• Correct tire pressure - Refer to the tire placard. • Correct tire size - Refer to the tire placard. • Abnormal tire wear or damage Did you find and correct the condition?		
4	Perform the Radial Tire Lead/Pull Correction . Did you find and correct the condition?	Go to Step 9	Go to Step 5
5	Inspect and correct/adjust the suspension and steering systems for the following conditions: • Vehicle trim height - Refer to Trim Height Specifications. • Excessively worn, loose, or damaged components Did you find and correct the condition?	Go to Step 9	Go to Step 6
6	Inspect the brake system for brake drag. With the vehicle suspended on a hoist, brake drag can be identified by rotating each wheel several times and observing whether more force is need to rotate the left wheel or the right wheel. Refer to Brake Rotor Thickness Variation Measurement . Did you find and correct the condition?	Go to Step 9	Go to Step 7
7	Inspect the wheel alignment and adjust as necessary. Refer to Wheel Alignment Measurement . Did you correct the condition?	Go to Step 9	Go to Step 8
8	Inspect the steering gear for unequal effort. The vehicle must be suspended on a hoist, the engine running, and the transmission in PARK or NEUTRAL. Grasp the tire assembly and manually simulate a turn from the left of center and the right of center observing whether more force is needed to turn to the left or to the right. If this condition exists replace the steering gear. Did you correct the condition?	System OK	Go to Step 3
9	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

BODY LEANS OR SWAYS IN CORNERS

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General

Step	Action	Yes	No
			Diagnosis
2	Verify the vehicle leans or sways in corners. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect the following components for wear or damage: • Rear Coil Springs • Front Coil Springs Are the components worn or damaged?	Go to Step 5	Go to Step 4
4	1. Inspect the stabilizer shaft link for wear or damage. 2. Repair as necessary. Did you find and correct the condition?	Go to Step 6	Go to Step 2
5	Replace the springs as necessary. Did you complete the repair?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

SUSPENSION BOTTOMS

Step	Action	Yes	No
DEFINITION: A loud bang or thump that can usually be felt and/or heard when the vehicle is driven over bumps. This condition is commonly noticed when the vehicle trim height is too low.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
2	Verify that the suspension bottoms. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect for vehicle overloading and correct the overloading condition as necessary. Refer to Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label for specifications. Did you find and correct the condition?	Go to Step 6	Go to Step 4
4	Inspect the following components: • Inspect the shock absorbers. Refer to Strut and Shock Absorber Inspection , for front and Strut and Shock Absorber Inspection for rear. • Inspect for damaged coil springs, torsion bar or leaf springs and replace as necessary.	Go to Step 6	Go to Step 5

Step	Action	Yes	No
	Did you find and correct the condition?		
5	Inspect the vehicle trim height. Refer to Trim Height Inspection . Did you complete the trim height inspection procedure?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

TORQUE STEER

Step	Action	Yes	No
DEFINITION: On a dry, smooth, flat road, the vehicle has a left or right steering force only during acceleration.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
2	1. Drive the vehicle on a straight, smooth, flat road. 2. Press the accelerator and determine if any additional steering input is required to maintain a straight ahead direction. 3. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal. Does the vehicle exhibit torque steer when the accelerator is pressed?	Go to Step 3	System OK
3	1. Drive the vehicle on a straight, smooth, flat road at 64 - 97 km/h (40 - 60 mph). 2. Remove your foot from the accelerator. 3. Shift the transmission into NEUTRAL in order to allow the vehicle to coast. 4. Is any additional steering input required to maintain a straight ahead direction. 5. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal. Does the vehicle direction change when the steering	Go to Vehicle Leads/Pulls	Go to Step 4

Step	Action	Yes	No
	wheel is momentarily released?		
4	Inspect the front suspension and powertrain mounts for worn or damaged components and repair as necessary. Did you find and correct the condition?	Go to Step 6	Go to Step 5
5	Inspect the vehicle trim height. Refer to Trim Height Inspection . Did you find and correct the condition?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

MEMORY STEER

Step	Action	Yes	No
DEFINITION: A lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
2	Verify that memory steer is present. Does the system operate normally?	System OK	Go to Step 3
3	1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Lubricate the tie rod ends and the ball joints if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. Did you find and correct the condition?	Go to Step 7	Go to Step 4
4	Inspect for binding strut bearings. 1. Disconnect the strut from the steering knuckle. 2. If the strut is abnormally difficult to rotate, repair or replace the upper bearing mount. Did you find and complete the repair?	Go to Step 7	Go to Step 5
5	Inspect for binding in the lower ball joints. If joint is binding, replace the joint. Did you find and complete the repair?	Go to Step 7	Go to Step 6
6	Inspect the wheel alignment and adjust as necessary. Refer to Wheel Alignment Measurement . Did you complete the wheel alignment?	Go to Step 7	-

Step	Action	Yes	No
7	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

WHEEL BEARINGS DIAGNOSIS

Step	Action	Values	Yes	No
1	Did you review the General Description and perform the necessary inspections?	-	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
2	Road test the vehicle in order to verify the customer's complaint. Does the vehicle operate normally?	-	System OK	Go to Step 3
3	1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Inspect for tire or wheel damage. Refer to Tire and Wheel Assembly Runout Measurement - On-Vehicle . Did you find and correct the condition?	-	Go to Step 7	Go to Step 4
4	1. Install the J 39570 chassis ear. 2. Road test the vehicle to verify the location of the wheel bearing noise. Did you locate the source of the wheel bearing noise?	-	Go to Step 6	Go to Step 5
5	IMPORTANT: Support the vehicle by the lower control arms or the rear axle to prevent movement during wheel bearing/hub inspection. 1. Mount and secure the J 8001 dial indicator set. 2. Ensure that the dial indicator contacts the vertical surface of the wheel as close as possible to the top wheel stud. 3. Push and pull on the top of the tire in order to inspect the total travel indicated by the dial indicator. Is the measurement greater then the specified value?	0.127 mm (0.005 in)	Go to Step 6	System OK

Step	Action	Values	Yes	No
6	Replace the wheel bearing. Refer to Front Wheel Bearing and Hub Replacement , or Rear Wheel Bearing and Hub Replacement . Did you complete the repair?	-	Go to Step 7	-
7	Road test the vehicle to verify the repair. Does the vehicle operate normally?	-	System OK	Go to Step 3

TRIM HEIGHT INSPECTION

Trim Height Measurement

Trim height is a predetermined measurement relating to vehicle ride height. Incorrect trim heights can cause the vehicle to bottom out over bumps, damage to the suspension components and symptoms similar to wheel alignment problems. Check the trim heights when diagnosing suspension concerns and before checking the wheel alignment.

Perform the following before measuring the trim heights:

- Set the tire pressure to the specifications shown on the certification label. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#)

NOTE: One U.S. gallon of gasoline weights approximately 6.5 lbs. One liter of gasoline weights approximately 0.7 kg.

- Check the fuel level. Add additional weight if necessary to simulate a full tank.
- Make sure the passenger and rear compartments are empty, except for the spare tire.
- Make sure the vehicle is on a flat and level surface, such as an alignment rack.
- Check that all the vehicle doors are securely closed.
- Check that the vehicle hood and rear deck lids are securely closed.
- Check for installed after market accessories or modifications that could affect trim height measurement:
 - Larger or Smaller than production wheels and tires.
 - Lifting or Lowering Kits
 - Wheel Opening Flares or Ground Affects

Measuring the P and R Dimension

Fig. 1: Identifying P And R Dimension

Courtesy of GENERAL MOTORS COMPANY

Measurement Definitions

P Height: The vertical distance from the ground to the top of the wheel opening through the centerline of the front wheel.

R Height: The vertical distance from the ground to the top of the wheel opening through the centerline of the rear wheel.

Use the following procedures to measure the P and R dimensions:

NOTE:

- Measure from the center of the wheel well opening to the ground.
- The left and right P and R height differences should be no more than 10 mm (0.39 in).

1. Push the front bumper down a minimum of 25 mm (1 in) and release. Perform this step three times.
2. Measure and record the trim height per the "Measurement Definitions" above.

3. Lift the bumper up a minimum of 25 mm (1 in) and release. Perform this step three times.
4. Measure and record the trim height per the "Measurement Definitions" above.
5. The true P height measurement is the average of the measurements taken in step 2 and 4. Refer to [Trim Height Specifications](#)
6. Repeat the above steps at the rear of the vehicle for the R heights.
7. If the P and R heights are outside of the specifications, measure the Z & D heights.

Measuring the Z Dimension

Fig. 2: Identifying Z Height Dimension

Courtesy of GENERAL MOTORS COMPANY

Measurement Definitions

The Z Height: The vertical distance from the front lower control arm rear bushing rear attach bolt head surface (2) to the center of the ball joint cup (1).

Fig. 3: Center Of Ball Joint Cup

Courtesy of GENERAL MOTORS COMPANY

Call out (1) is the center of the ball joint cup.

Fig. 4: Front Lower Control Arm Rear Bushing Rear Attach Bolt Head Surface

Courtesy of GENERAL MOTORS COMPANY

Call out (2) is the front lower control arm rear bushing rear attach bolt head surface.

Use the following procedures to measure the Z dimensions:

NOTE: The left and right Z height differences should be no more than 10 mm (0.39 in).

1. Push the front bumper down a minimum of 25 mm (1 in) and release. Perform this step three times.
2. Measure and record the trim height per the "Measurement Definitions" above.
3. Lift the front bumper a minimum of 25 mm (1 in) and release. Perform this step three times.
4. Measure and record the trim height per the "Measurement Definitions" above.
5. The true Z height dimension is the average of the measurements taken in steps 2 and 4. Refer to [Trim Height Specifications](#)
6. If these measurements are out of specifications, inspect for the following conditions:
 - Worn or damaged suspension components
 - Collision damage

D Height Measurement

Fig. 5: Identifying D Height

Courtesy of GENERAL MOTORS COMPANY

Measurement Definitions

The D Height: The vertical distance from the bottom surface of the body side rail (1) to the center of the lower shock attaching bolt head (2).

Use the following procedure to check the D dimension:

NOTE: **The left and right D height difference should be no more than 10 mm (0.39 in).**

1. Push the rear bumper down a minimum of 25 mm (1 in) and release. Perform this step three times.
 2. Measure and record the trim height per the "Measurement Definitions" above.
 3. Lift the rear bumper up a minimum of 25 mm (1 in) and release. Perform this step three times.
 4. Measure and record the trim height per the "Measurement Definitions" above.
 5. The true D height is the average of the measurements taken in steps 2 and 4. Refer to [Trim Height Specifications](#)
 6. If these measurements are out of specifications, inspect for the following conditions:
 - Worn or damaged suspension components
 - Collision damage
-

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0569: SYSTEM CONFIGURATION MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0569 00

System Configuration Malfunction

Circuit/System Description

If the tire type and pressure information is not entered during the body control module (BCM) setup, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the ignition is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0569 will be set and the tire type and pressure information will need to be entered for the system to function correctly.

Conditions for Running the DTC

Ignition On/Vehicle in Service Mode.

Conditions for Setting the DTC

The tire type and pressure information is not entered into the BCM during programming and setup.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has undergone the tire type and pressure selection setup procedure and one ignition cycle has occurred.

Diagnostic Aids

A newly replaced BCM will set DTC C0569 after programming on it's initial ignition ON cycle if the module setup information has not been entered.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation (UJM)

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.
2. Enter the tire type and pressure information into the K9 Body Control Module with a scan tool. Refer to Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label.
3. Ignition OFF, then Ignition On/Vehicle in Service Mode.
4. Verify DTC C0569 is not set.
 - **If the DTC is set**

Replace the K9 Body Control Module.
 - **If the DTC is not set.**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for control module replacement, programming, and setup.

DTC C0750, C0755, C0760, OR C0765: TIRE PRESSURE SENSORS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC C0765 39

Right Rear Tire Pressure Sensor Internal Malfunction

Circuit/System Description

The tire pressure monitor system has a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force puts the sensor into Drive mode. The sensors send the tire pressure data to the remote control door lock receiver (RCDLR) which in turn translates the received sensor data into sensor presence, sensor mode, and tire pressure before passing it onto the body control module (BCM). Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the first sensor to go into Drive mode, then checks if all sensors have gone into Drive mode. If one or more sensors does not go into these modes, or does not transmit at all, the BCM will set DTC C0750, C0755, C0760, or C0765 respectively.

Conditions for Running the DTC

Vehicle speed is greater than 40 km/h (25 MPH).

Conditions for Setting the DTC

- A sensor does not transmit or transmits invalid data to the BCM.
- A sensor low battery condition.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the malfunction is no longer present and one ignition cycle occurs.

Diagnostic Aids

- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool is placed along the tire sidewall and no further than 15 cm (6 in) from the sensor and the antenna is aiming upward.
- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#).
- Occasionally sensor transmissions are not received by the BCM due to vehicle level radio frequency interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed. Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to [Tire Pressure Indicator Sensor Learn](#).
- A sensor low battery condition will set a sensor DTC but will not illuminate the low tire pressure indicator or display a message on the driver information center, if equipped. The sensor battery condition can be verified in the scan tool BCM data list. If a sensor low battery condition is indicated on the scan tool, the sensor will need

to be replaced. Refer to [Tire Pressure Indicator Sensor Replacement](#).

- The Hit Rate of the sensor will help confirm the success rate at which the sensor transmission is being received. A low Hit Rate will signal that there may be interference.

Reference Information

Description and Operation

[Tire Pressure Monitor Description and Operation \(UJM\)](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Verify there are no communication DTCs set along with DTC C0750, C0755, C0760, and C0765.
 - **If a communication DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - **If a communication DTC is not set**
2. Verify the scan tool Tire Pressure Sensor Rolling Count parameter of all 4 tire pressure sensors is above 50%.
 - **If the Tire Pressure Sensor Rolling Count parameter is below 50% on one or more tires**

NOTE: When moving the tire pressure sensor to a different location on the vehicle, keep the tire pressure sensor with the original tire it is installed in.

1. Move the appropriate tire to a different location on the vehicle and verify the Tire Pressure Sensor Rolling Count has increased. Refer to [Tire and Wheel Removal and Installation](#) .
 - If Tire Pressure Sensor Rolling Count parameter does not increase after moving tire to different location, replace the appropriate B2 Tire Pressure Sensor and perform the [Tire Pressure Indicator Sensor Learn](#).
 - If Tire Pressure Sensor Rolling Count parameter does increase after moving tire to different location, check for any aftermarket devices that could be causing interference to the tire pressure sensor signal.
 - **If the Tire Pressure Sensor Rolling Count parameter is above 50% on one or more tires**
3. Verify if all 4 tire monitor pressure sensor DTCs are not set.
 - If 2 or more tire monitor pressure sensor DTCs are set, test the keyless entry antenna for proper operation, or if antenna is properly seated. Refer to [Keyless Entry System Malfunction \(Active\)](#) [Keyless Entry System Malfunction \(Passive\)](#)
4. Perform the [Tire Pressure Indicator Sensor Learn](#).
5. Verify the scan tool Tire Pressure Sensor Mode parameters change to Drive while driving the vehicle above 40 km/h (25 mph) for greater than 2 min.
 - **If a Tire Pressure Sensor Mode parameter does not change to Drive**
 1. Replace the appropriate B2 Tire Pressure Sensor.
 2. Perform the [Tire Pressure Indicator Sensor Learn](#).

- If the Tire Pressure Sensor Mode parameter changes to Drive

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Tire Pressure Indicator Sensor Replacement](#)
- Refer to [Tire Pressure Indicator Sensor Learn](#)

DTC C0775: TIRE PRESSURE MONITORING SYSTEM SENSORS MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0775 00

Tire Pressure Monitoring System Sensors Malfunction

Circuit/System Description

If the body control module (BCM) has been reprogrammed or replaced and the tire pressure sensor learn procedure has not been performed, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0775 will be set in the BCM and the tire pressure sensor learn procedure will need to be performed for the system to function correctly.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The body control module (BCM) has not learned tire pressure sensor ID and location information from the tire pressure sensors.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type warning message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has received tire pressure sensor ID and location after tire pressure sensor indicator learn procedure has been performed.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation (UJM)

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Perform the Tire Pressure Indicator Sensor Learn.
2. Verify DTC C0775 is not set.
 - **If the DTC is set**
 1. Test the keyless entry antenna for proper operation. Refer to Keyless Entry System Malfunction (Active) Keyless Entry System Malfunction (Passive) .
 2. Clear DTC.
 3. Verify DTC does not set.
 - If the DTC sets, replace the K9 Body Control Module.
 - If the DTC does not set.

All OK.

 - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for control module replacement, programming, and setup.

SYMPTOMS - TIRE PRESSURE MONITORING

1. Perform the Diagnostic System Check - Vehicle , before using the Symptom Tables in order to verify that all of the following are true:
 - The control modules can communicate via the serial data link.
 - If one of the current or previous sensor learn is not successful.
 - If there are dashes displayed in the driver information center. Refer to Tire Pressure Rolling Count Procedure
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Tire Pressure Monitor Description and Operation (UJM).

Visual/Physical Inspection

- Inspect if tires are inflated per placard values.
- Inspect for aftermarket devices which could affect the operation of the Tire Pressure Monitoring (TPM) System. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to [Low Tire Pressure Indicator Malfunction](#) in order to diagnose the symptom.

LOW TIRE PRESSURE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The tire pressure monitor system has a radio frequency transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force puts the sensor into Drive mode. The sensors send the tire pressure data to the remote control door lock receiver (RCDLR), using radio frequency (RF) transmissions. The RCDLR then decodes the RF data and passes it to the body control module (BCM). In turn, the BCM translates the data contained in the tire pressure sensor radio frequency transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the sensors to go into Drive mode.

Each sensor has its own unique identification (ID) code, which it transmits as part of each RF message, that must be learned into the BCM memory. Once all 4 IDs have been learned and vehicle speed is greater than 40 km/h (25 mph), the BCM continuously compares IDs and pressure data in the received transmissions to the learned IDs and vehicle placard pressures to determine if all 4 sensors are present and if one or more tires are low. If the BCM detects a low tire pressure condition or a malfunction in the system, it will send a serial data message to the instrument cluster requesting the appropriate tire pressure monitor indicator illumination and also to display the appropriate data message on the driver information center, if equipped.

Diagnostic Aids

- If unsure about the condition, cycle the ignition and observe the tire pressure monitor indicator icon. If the tire pressure monitor indicator icon is continuously illuminated after the instrument cluster bulb check is completed, a low tire pressure condition is present. Check the tires for damage or leaks and inflate to the tire placard specifications. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#) . If the tire pressure monitor indicator icon flashes for 1 min after the instrument cluster bulb check is completed and then remains illuminated, a tire pressure monitor system DTC is set. Perform the [Diagnostic System Check - Vehicle](#) to proceed with the proper diagnosis.
- Temperature can greatly effect tire pressures. Low tire pressure on a cold morning may cause the tire pressure monitor indicator icon to turn ON. The air pressure in the tire increases as the ambient temperature rises or as the tire warms up while the vehicle is driven. The pressure may increase enough to exceed the predetermined low pressure threshold which will turn OFF the tire pressure monitor indicator icon.
- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool antenna is no further than 15 cm (6 in) from the sensor and is aiming upward.
- Aftermarket wheel value stem locations can cause a sensor to not function correctly.

- A sensor may have been damaged due to a previous wheel/tire service or flat tire event. This is a courtesy item as it is not covered by warranty.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#).
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal is being blocked by another component.
- Occasionally sensor transmissions are not received by the BCM due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The Hit Rate of the sensor will help confirm the success rate at which the sensor transmission is being received. A low Hit Rate will signal that there may be interference. Refer to [Tire Pressure Rolling Count Procedure](#).

Reference Information

Description and Operation

[Tire Pressure Monitor Description and Operation \(UJM\)](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

NOTE: Low tire pressure in one or more tires is indicated by a continuously illuminated tire pressure monitor indicator icon after the instrument cluster bulb check is completed. If equipped with a driver information center, a check tire pressure type message will also be displayed.

When a tire pressure monitor DTC is set, the tire pressure monitor indicator icon will flash for 1 min after the instrument cluster bulb check is completed and then remains illuminated. If equipped with a driver information center, a service tire monitor type message will also be displayed.

1. Adjust all tire pressures to the correct pressure. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#).
2. Drive the vehicle over 40 km/h (25 mph) for greater than 2 min.
3. Verify the low tire pressure indicator is OFF.
 - **If the low tire pressure indicator is ON**
 1. Perform the [Tire Pressure Indicator Sensor Learn](#).
 2. Record all 4 Tire Pressure Parameters values from the scan tool.
 3. Check and record the tire pressures with a known accurate hand held tire pressure gauge.
 4. Verify that the scan tool Tire Pressure parameters do not differ more than 27.6 kPa (4 psi) from the actual tire pressure readings.
 - If the scan tool Tire Pressure parameters differ more than 27.6 kPa (4 psi), replace the appropriate

B2 Tire Pressure Sensor then perform the [Tire Pressure Indicator Sensor Learn](#).

- If the scan tool Tire Pressure parameters do not differ more than 27.6 kPa (4 psi)

5. Verify the BCM Tire Type and Pressure selections are setup correctly with a scan tool. Refer to the [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#) .

- If the BCM Tire Type and Pressure selections are incorrect, input the proper placard values for the vehicle with the scan tool then drive the vehicle over 40 km/h (25 mph) for greater than 2 min.
- If the BCM Tire Type and Pressure selections are correct

6. Ignition On/Vehicle in Service Mode.

7. Verify the low tire pressure monitor indicator icon turns ON and OFF when commanding All Indicators ON and OFF with a scan tool.

- If the low tire pressure monitor icon does not turn ON and OFF, replace the P16 Instrument Cluster.
- If the low tire pressure monitor icon turns ON and OFF

8. All OK

- **If the tire pressure indicator is OFF**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Tire Pressure Indicator Sensor Replacement](#)
- Refer to [Tire Pressure Indicator Sensor Learn](#)
- Refer to [Control Module References](#) for control module replacement, programming, and setup.

TIRE PRESSURE ROLLING COUNT PROCEDURE

Introduction

The Tire Pressure Rolling Count parameter for each sensor can be used to help confirm if the sensor transmissions are being received. As the vehicle is being driven, the Tire Pressure Rolling Count increments with every received TPM sensor transmission. If a suspected Sensor is not incrementing, incrementing very slowly compared to others or not at all, that could be a result of interference from aftermarket devices. The sensor transmission success rate (the rate at which each sensors transmission is being received by the RCDLR) can be verified in the scan tool.

NOTE: Scan tool procedure will be used if Tire Pressure Sensor exhibits "no Signal or poor intermittent signal reception" Before proceeding, check for the following:

Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

- A sensor does not transmit or transmits invalid data to the RCDLR.
- A sensor might exhibit low battery condition.
- If equipped, the driver information center displays " dashes" for the suspected sensor.
- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the

sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#)

- Occasionally sensor transmissions are not received by the RCDLR due to vehicle level radio frequency interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting

How to determine if Sensor Signal is poor or has no signal

Use Scan Tool and follow on screen instructions:

1. Select Module Diagnosis
2. Select Body Control Module
3. Select Configuration/Reset Functions
4. Select Tire Pressure Sensor Signal Reset
5. The Tire Pressure Sensor Rolling Count parameters will be displayed

If the Tire Pressure Sensor Rolling Count parameter is below 50% on one or more tires

NOTE: When moving the tire pressure sensor to a different location on the vehicle, keep the tire pressure sensor with the original tire it is installed in.

- Move the appropriate tire to a different location on the vehicle and verify the Tire Pressure Sensor Rolling Count has increased. Refer to [Tire and Wheel Removal and Installation](#) .
- If Tire Pressure Sensor Rolling Count parameter does not increase after moving tire to different location, replace the appropriate B2 Tire Pressure Sensor and perform the [Tire Pressure Indicator Sensor Learn](#).
- If Tire Pressure Sensor Rolling Count parameter does increase after moving tire to different location, check for any aftermarket devices that could be causing interference to the tire pressure sensor signal. Unplug the device and re-run test.

If the Tire Pressure Sensor Rolling Count parameter is above 50% on one or more tires (Follow normal TPM troubleshooting in Service information)

1. Verify if all 4 tire monitor pressure sensor DTCs are not set.
2. If 2 or more tire monitor pressure sensor DTCs are set, test the keyless entry antenna for proper operation, or if antenna is properly seated. Refer to [Keyless Entry System Malfunction \(Active\)](#) [Keyless Entry System Malfunction \(Passive\)](#) .
3. Perform the [Tire Pressure Indicator Sensor Learn](#).
4. Verify the scan tool Tire Pressure Sensor Mode parameters change to Drive while driving the vehicle above 40 km/h (25 mph) for greater than 2 min.
5. If a Tire Pressure Sensor Mode parameter does not change to Drive.
6. Replace the appropriate B2 Tire Pressure Sensor.
7. Perform the [Tire Pressure Indicator Sensor Learn](#).
8. If the Tire Pressure Sensor Mode parameter changes to Drive.
9. All OK.

REPAIR INSTRUCTIONS

TIRE PRESSURE INDICATOR SENSOR REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
3. Dismount the tire from the rim. Refer to [Tire Dismounting and Mounting](#)

Fig. 1: Tire Pressure Indicator Sensor Components

Courtesy of GENERAL MOTORS COMPANY

NOTE: Never fit the tire pressure indicator sensor on unapproved wheel rims.

NOTE: Whenever the tire will be removed from the rim, install a new valve stem and a new bolt. Do not reuse the old parts.

4. Remove and DISCARD the bolt (1) from the tire pressure transmitter (2) and pull it straight off the tire pressure valve stem (3).

CAUTION: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

5. Remove and DISCARD the tire pressure valve stem by pulling it through the rim.

Installation Procedure

Fig. 2: Tire Pressure Indicator Sensor Components

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Ensure the flat of the valve lines up with the flats of the snap in the enclosure.
- Valve stems and bolts are single use items.

1. Assemble the tire pressure transmitter (2) to the NEW valve stem (1) and install the NEW bolt (3).

Fig. 3: Anti Rotation Pin

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

2. Insert an anti rotation pin (1) through the cross-drilled hole in the valve stem and tighten the bolt to 1.4 N.m (12.4 lb in).

NOTE: When mounting the tires, use an approved tire mounting lubricant.

3. Apply tire soap to the rubber portion of the valve stem (2).

Fig. 4: Pull Valve Stem Through Rim Using Special Tool

Courtesy of GENERAL MOTORS COMPANY

4. Using a tire valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.

Fig. 5: Proper Valve Stem Seating

Courtesy of GENERAL MOTORS COMPANY

5. Check the valve stem (1) for correct seat on the rim (2).
 - The rim hole edge has to be completely in the notch of the valve stem.
 - The valve and the rim hole have to be concentric.

Fig. 6: Tire Pressure Transmitter To Valve Stem Gap

Courtesy of GENERAL MOTORS COMPANY

6. Make sure that there is a gap between the valve stem (1) and the tire pressure transmitter (2).

NOTE: The tire should not have contact with the tire pressure indicator sensor during installation to prevent a damage of the tire pressure indicator sensor.

7. Mount the tire to the rim. Refer to [Tire Dismounting and Mounting](#)
8. Inflate the tire to the specified pressure as stated on the tire placard.
9. Install the NEW dust cap.
10. Balance the tire and wheel assembly.
11. Install the tire and wheel assembly. Refer to [Tire and Wheel Removal and Installation](#)
12. Learn the tire pressure indicator sensor. Refer to [Tire Pressure Indicator Sensor Learn](#).
13. Lower the vehicle.

TIRE PRESSURE INDICATOR SENSOR LEARN

Special Tools

- **EL-46079** Tire Pressure Monitor Diagnostic Tool
- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to [Special Tools \(UJM\)](#).

Learn Mode Description

The tire pressure monitor system uses the instrument cluster, body control module (BCM), 4 radio frequency transmitting pressure sensors, remote control door lock receiver (RCDLR) and the serial data circuit to perform the tire pressure monitor learn mode functions. The sensor learn procedure must be performed after every tire rotation, BCM replacement, or sensor replacement. Once the Learn mode has been enabled, each of the sensors unique identification codes can be learned into the BCM memory. When a sensor ID has been learned, the BCM sounds a horn chirp indicating the sensor has transmitted its ID and the BCM has received and learned it. The BCM must learn the sensor IDs in the proper sequence to determine correct sensor location. The first learned ID is assigned to the left front location, the second to right front, the third to right rear and the fourth to left rear. The turn signals will

individually illuminate indicating which location is to be learned in the proper sequence.

Sensor Functions Using EL-46079, EL-50448, or Equivalent

Each sensor has an internal low frequency coil. When the tire pressure monitor special tool is used in activate mode, it produces a low frequency transmission that activates the sensor. The sensor responds to a low frequency activation by transmitting in Learn Mode-Remotely Triggered. When the BCM receives a learn mode transmission while in Learn mode, it will assign that sensors ID to the location on the vehicle relative to the order in which it was learned.

Learn Mode Cancellation

The Learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor or 5 min overall has elapsed to match all four sensors. If the relearn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the relearn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the BCM memory.
- If equipped, the driver information center will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the Learn procedure to be repeated for the system to function properly.

Tire Pressure Monitor Learn Procedure

NOTE: In the event a particular sensor is activated and the horn does not chirp, it may be necessary to rotate the wheel so that the valve stem is in a different position due to the sensor signal is being blocked by another component. Make sure the TPM tool battery is sufficient to complete TPM learn process. Do not place the TPM tool directly on the valve stem. The TPM tool should be placed against the tire sidewall near the valve stem. The TPM sensor learn activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning.

1. Apply park brake (manual transmission only).
2. Ignition On/Vehicle in Service Mode, using a scan tool or driver information center buttons (refer to owners manual), initiate the Tire Pressure Sensors Learn mode. A double horn chirp will sound indicating the Learn mode has been enabled. The left front turn signal will also be illuminated.
3. Starting with the left front tire, active the sensor by holding the antenna of the tire pressure monitor special tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for a horn chirp. If the horn does not chirp, repeat the sensor activation sequence with the tool. Once the horn chirp has sounded, the sensor information is learned and the turn signal in the next location to be learned will illuminate.
4. After the horn chirp has sounded and the right front turn signal is illuminated, repeat step 3 for the remaining 3 sensors in the following order:
 1. Right front
 2. Right rear
 3. Left rear
5. When the left rear sensor has been learned and a double horn chirp has sounded, the learn process is complete and the BCM exits the Learn mode.

DESCRIPTION AND OPERATION

TIRE PRESSURE MONITOR DESCRIPTION AND OPERATION (UJM)

B2RF	B2RF Tire Pressure Sensor - Right Front
B2RR	B2RR Tire Pressure Sensor - Right Rear

Special Tools

- **EL-46079/J-46079** Tire Pressure Monitor Diagnostic Tool
- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to [Special Tools \(UJM\)](#).

The tire pressure monitor system warns the driver when a significant loss of tire pressure occurs in any of the 4 tires and allows the driver to display the individual tire pressures and their locations on the driver information center.

The system uses the body control module (BCM), driver information center, instrument cluster, remote control door lock receiver (RCDLR), and a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly, and the serial data circuit to perform the system functions. Each sensor has an internal power supply with an approximate 10 year service life.

When the vehicle is stationary, the sensor's internal accelerometer is inactive, which puts the sensors into a Stationary state. In this state the sensors sample tire pressure once every 30 seconds and do not transmit at all if the tire pressure does not change. As vehicle speed increases, centrifugal force activates the sensors internal accelerometer causing the sensors to go into Wake and then Drive mode. In Drive mode, the sensors sample tire pressure once every 30 seconds and transmit in Drive mode once every 60 seconds. The RCDLR receives and translates the data contained in each sensors RF transmission into sensor presence, sensor mode, and tire pressure and passes it to the BCM. In turn, the BCM sends the tire pressure and tire location data to the driver information center via the serial data circuit where they are displayed.

The sensors continuously compare their last pressure sample to their current pressure sample and will transmit in Learn Mode-Pressure Triggered if a 8.3 kPa (1.2 psi) change in tire pressure has been detected in either a Stationary or Drive state. When the tire pressure monitor system detects a significant loss of tire pressure, the tire pressure monitor indicator icon is illuminated on the instrument cluster and if equipped, a tire pressure low, add air to tire type message is displayed on the driver information center. Both the indicator icon and driver information center message can be cleared by adjusting the tire pressures to the recommended pressures and driving the vehicle above 40 km/h (25 mph) for at least 2 minutes.

If power is disconnected from the BCM or if the vehicle battery is disconnected, each tire pressure monitor sensor ID is retained but all of the tire pressure information is lost. Under these circumstances the BCM cannot assume that the tire pressures were maintained over an unknown period of time. If equipped, the driver information center will display all dashes and the scan tool will indicate a default tire pressure value of 1020 kPa (148 psi) for each tire. Driving the vehicle above 40 km/h (25 mph) for at least 2 minutes will activate the sensors causing the driver information center to display the current tire pressures. The **EL-46079/J-46079** tire pressure monitor diagnostic tool, **EL-50448** tire pressure monitor sensor activation tool, or equivalent may also be used to activate the sensors as well.

The BCM has the ability to detect malfunctions within the tire pressure monitor system. In the event a DTC is set, the tire pressure monitor indicator icon on the instrument cluster, if equipped will flash for 1 minute and then remain illuminated after the ignition is turned ON and the instrument cluster bulb check has been completed. Any malfunction detected will cause the driver information center to display a service tire monitor system type message. For more information on other functions of the BCM, refer to [Keyless Entry System Description and Operation](#) .

DIAGNOSTIC INFORMATION AND PROCEDURES

TIRE DIAGNOSIS - IRREGULAR OR PREMATURE WEAR

Tire Wear

Fig. 1: Identifying Types Of Tire Wear

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Under-Inflation, Hard Cornering, Lack of Regular Rotation
2	Incorrect Wheel Alignment, Hard Cornering, Lack of Regular Rotation
3	Incorrect Wheel Alignment
4	Over-Inflation, Heavy Acceleration, Lack of Regular Rotation
5	Normal Wear to the Wear Indicator

Inspection Procedure

1. Inspect the front tire wear.
2. Inspect the rear tire wear.
3. Rotate the tires if any of the following conditions exist:
 - The amount of time or mileage since the last tire rotation matches the maintenance schedule.
 - The outer tread blocks are worn more than the middle tread blocks (1).
 - The outer tread blocks are worn more than the inner tread blocks (2).
 - The middle tread blocks are worn more than the outer tread blocks (4).
4. Measure the wheel alignment if any of the following conditions exist:
 - The tread blocks have feathered edges (3).
 - The outer tread blocks are worn more than the inner tread blocks (2).
 - The inner tread blocks are worn more than the outer tread blocks (2).
5. Inspect the struts or the shock absorbers if the tire tread exhibits a cupped appearance (3).

TIRE DIAGNOSIS - WADDLE COMPLAINT

Fig. 2: Identifying Tire Wobble/Waddle

Courtesy of GENERAL MOTORS COMPANY

Tire waddle is a side to side movement at the front of the vehicle and/or the rear of the vehicle. Tire waddle can be caused by the following conditions:

- A steel belt not being straight within the tire
- Excessive lateral runout of the tire
- Excessive lateral runout of the wheel

The tire waddle is most noticeable at a low speed of about 8 - 48 km/h (5 - 30 mph). Tire waddle may appear as ride roughness at 80 - 113 km/h (50 - 70 mph). Tire waddle may appear as a vibration at 80 - 113 km/h (50 - 70 mph).

Inspection Procedure

1. Raise and support the vehicle with safety stands. Refer to [**Lifting and Jacking the Vehicle**](#) .

CAUTION: **Wear gloves when inspecting the tires in order to prevent personal injury**

from steel belts sticking through the tire.

2. Perform the following preliminary inspection:
 1. Mark the tire with a crayon in order to note the start and the stop position.
 2. Rotate each tire and wheel by hand.
 3. Inspect the tire for bulges or bent wheels. Replace as necessary.
3. Use tire substitution in order to identify the faulty tire. Perform the following steps for a tire substitution check:
 1. Use a comparable tire in order to replace each tire, one at a time.
 2. Test drive the vehicle.
 3. If the problem is tire or wheel related, you will eliminate the problem when you remove the faulty tire from the vehicle.

WHEEL MOUNTING SURFACE CHECK

Replace any wheels that are bent or dented, or have excessive lateral or radial runout. Wheels with runout greater than specified may cause objectionable vibrations.

Fig. 3: Checking Wheel Mounting Surface

Courtesy of GENERAL MOTORS COMPANY

1. Thoroughly clean the wheel mounting surface with a clean shop towel and denatured alcohol, or equivalent.
2. Use a straight edge 203 - 229 mm (8 - 9 in) long. Place the straight edge on the wheel inboard mounting surface. Try to rock the straight edge up and down within the mounting surface.
3. For aluminum flat-mount wheels, repeat the procedure in step 2 on at least 3 - 4 different positions on the inboard mounting surface.

If you can rock the straight edge, the mounting surface is bent and you must replace the wheel.

4. Inspect the mounting wheel/nut holes for damage caused from over-torquing the wheel/nuts. Inspect for collapsed wheel/nut bosses. Inspect for cracked wheel bosses.

Fig. 4: Inspecting Wheel Inboard Mounting Surface

Courtesy of GENERAL MOTORS COMPANY

5. For steel wheels, repeat the procedure in step 2 on at least 3 - 4 different positions on the inboard mounting surface.
 - The outer mounting ring is designed to be raised slightly above the inner mounting ring.
 - If you can rock the straight edge, the mounting surface is bent and you must replace the wheel.

Fig. 5: Identifying Mounting Wheel/Nut Holes Damage

Courtesy of GENERAL MOTORS COMPANY

6. Inspect the mounting wheel/nut holes for damage caused from over-torquing the wheel/nuts. Inspect for collapsed wheel/nut bosses. Inspect for cracked wheel bosses.

CAUTION: The use of non-GM original equipment wheels may cause:

- Damage to the wheel bearing, the wheel fasteners and the wheel
- Tire damage caused by the modified clearance to the adjacent vehicle components
- Adverse vehicle steering stability caused by the modified scrub radius
- Damage to the vehicle caused by the modified ground clearance
- Speedometer and odometer inaccuracy

- Replacement wheels must be equivalent to the original equipment wheels in the following ways:
 - The load capacity
 - The wheel diameter
 - The rim width
 - The wheel offset
 - The mounting configuration
- A wheel of the incorrect size or type may affect the following conditions:
 - Wheel and hub-bearing life
 - Brake cooling
 - Speedometer/odometer calibration
 - Vehicle ground clearance
 - Tire clearance to the body and the chassis

IMPORTANT:

7. Replace the wheel if the wheel is bent.
8. Replace the wheel if the wheel/nut boss area is cracked.

Identify steel wheels with a 2 or 3 - letter code stamped into the rim near the valve stem. Aluminum wheels have the code, the part number, and the manufacturer identification cast into the back side of the wheel.

RADIAL TIRE LEAD/PULL CORRECTION

Step	Action	Yes	No
DEFINITION: Lead/pull is the deviation of the vehicle from a straight path on a level road with no pressure on the steering wheel.			
1	Did you perform the Vehicle Leads/Pull diagnostic table?	Go to Step 2	Go to Vehicle Leads/Pulls
2	Road test the vehicle to verify the complaint. Select a smooth level surface to perform the test. Does the condition exist?	Go to Step 3	System OK
3	1. Cross-switch the front tire/wheel assemblies. Refer to Tire and Wheel Removal and Installation . 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to Step 4	System OK
4	Does the vehicle lead/pull in the opposite direction?	Go to Step 5	Go to Wheel Alignment Measurement
5	1. Cross-switch the left front tire/wheel assembly with the left rear tire/wheel assembly. Refer to Tire and Wheel	Go to Step 6	Go to Step 7

Step	Action	Yes	No
	<u>Removal and Installation.</u> 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?		
6	1. Cross-switch the right front tire/wheel assembly with the right rear tire/wheel assembly. Refer to <u>Tire and Wheel Removal and Installation.</u> 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to <u>Wheel Alignment Measurement</u>	Go to Step 8
7	Replace the left rear tire. Refer to <u>Tire Dismounting and Mounting.</u> Is the repair complete?	Go to Step 9	-
8	Replace the right rear tire. Refer to <u>Tire Dismounting and Mounting.</u> Is the repair complete?	Go to Step 9	-
9	Verify proper vehicle operation. Does the original condition still exist?	Go to Step 1	System OK

REPAIR INSTRUCTIONS

TIRE AND WHEEL REMOVAL AND INSTALLATION

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools.**

Removal Procedure

1. Raise and support the vehicle. **Lifting and Jacking the Vehicle**
2. Remove the wheel cover, if equipped.

Fig. 6: Wheel Nut Caps

Courtesy of GENERAL MOTORS COMPANY

3. Remove the wheel nut caps (1), if equipped.

Fig. 7: Wheel Nuts

Courtesy of GENERAL MOTORS COMPANY

4. Remove the wheel nuts (1).

Fig. 8: Tire & Wheel Assembly

Courtesy of GENERAL MOTORS COMPANY

5. Remove the tire and wheel assembly (1).

WARNING: If penetrating oil gets on the vertical surfaces between the wheel and the rotor or drum it could cause the wheel to work loose as the vehicle is driven, resulting in loss of control and an injury accident.

CAUTION: Removing the wheel may be difficult because of foreign materials or a tight fit between the wheel and the hub/rotor. Slightly tap the tire side wall with a rubber mallet in order to remove the wheel. Failure to follow these instructions may result in damage to the wheel.

CAUTION: Never use heat to loosen a tight wheel bolt or nut. This can shorten the life of wheel and damage wheel bearings.

6. If the tire and wheel assembly is difficult to remove or cannot be removed, perform the following steps:

- Hand install the wheel nuts.
- Loosen the wheel nuts 2 complete turns.

- Lower the vehicle.
 - Rock the vehicle from side to side.
 - Repeat the procedure if necessary.
7. When the tire and wheel assembly loosens, raise and support the vehicle. [Lifting and Jacking the Vehicle](#)
 8. Remove the wheel nuts.
 9. Remove the tire and wheel assembly.
 10. If necessary and equipped, remove the center cap.

Installation Procedure

WARNING: Before installing the wheels, remove any buildup of corrosion on the wheel mounting surface and brake drum or disc mounting surface. Installing wheels with poor metal-to-metal contact at the mounting surfaces can cause wheel nuts to loosen. This can cause a wheel to come off when the vehicle is moving, causing loss of control and possibly personal injury.

NOTE: Do not use power grinding tools to clean the brake rotor or drum to wheel mating surfaces.

1. Using a wire brush or wire wheel, clean the wheel to brake rotor or drum mating surface.
2. Using the **CH-41013** Rotor Resurfacing Kit, clean the rotor or drum to wheel contact area.
3. Using the **CH-42450-A** Wheel Hub Resurfacing Kit, clean the surfaces around the wheel studs.
4. Clean the threads of the wheel studs.
5. If the threads of the wheel stud are damaged, replace the wheel stud. [Wheel Stud Replacement](#) , or [Wheel Stud Replacement](#)
6. After cleaning all of the wheel and brake rotor or drum contact areas, use brake cleaner or denatured alcohol to remove any dirt and debris from the wheel nuts and the brake rotor or drum.
7. Inspect and clean the contact areas of the wheel. [Wheel Mounting Surface Check](#)

Fig. 9: Rim Inner Center Seat

Courtesy of GENERAL MOTORS COMPANY

8. Apply a small amount of lubricant to the inner diameter of the wheel hub pilot hole (1) where it contacts the wheel hub flange. **Adhesives, Fluids, Lubricants, and Sealers**

Fig. 10: Tire & Wheel Assembly

Courtesy of GENERAL MOTORS COMPANY

9. Install the tire and wheel assembly (1).

Fig. 11: Wheel Nuts

Courtesy of GENERAL MOTORS COMPANY

WARNING: Never grease or lubricate wheel nuts, studs and mounting surfaces. Wheel nuts, studs, and mounting surfaces must be clean and dry. Tightening the lubricated parts can cause damage to the wheel studs. This can cause a wheel to come off when the vehicle is moving, causing loss of control and possibly personal injury.

10. Hand install the wheel nuts (1).

Fig. 12: Wheel Nut Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Improperly tightened wheel bolts or nuts can lead to brake pulsation and rotor damage. In order to avoid expensive brake repairs, evenly tighten the wheel bolts or nuts to the proper torque specification.

CAUTION: Refer to [Fastener Caution](#) .

11. Using a torque wrench and the appropriate socket, alternately and evenly tighten the wheel nuts to 140 N.m (103 lb ft) in the sequence illustrated.

Fig. 13: Wheel Nut Caps

Courtesy of GENERAL MOTORS COMPANY

12. Install the wheel nut caps (1), if equipped.
13. Install the wheel center cap or wheel cover, if equipped.

TIRE REPAIR

Fig. 14: Identifying Repairable Area On A Radial Tire

Courtesy of GENERAL MOTORS COMPANY

WARNING:

- Tire changing can be dangerous and should be done by trained professionals using proper tools and procedures. Always read and understand any manufacturer's warnings contained in their customers literature or molded into the tire sidewall.
- Serious eye and ear injury may result from not wearing adequate eye and ear protection while repairing tires.
- NEVER inflate beyond 275 kPa (40 pounds) pressure to seat beads.
- NEVER stand, lean or reach over the assembly during inflation.

NOTE:

Repairable area on a radial tire.

- NEVER repair tires worn to the tread indicators 1.59 mm (2/32 in) remaining depth.
- NEVER repair tires with a tread puncture larger than 6.35 mm (1/4 in).
- NEVER substitute an inner tube for a permissible or non-permissible

repair.

- **NEVER** perform an outside-in tire repair (plug only, on the wheel).
- Every tire must be removed from the wheel for proper inspection and repair.
- Regardless of the type of repair used, the repair must seal the inner liner and fill the injury.
- Consult with repair material supplier/manufacturer for repair unit application procedures and repair tools/repair material recommendations.

Three basic steps for tire puncture repair:

1. Remove the tire from the wheel for inspection and repair.
2. Fill the injury (puncture) to keep moisture out.
3. Seal the inner liner with a repair unit to prevent air loss.

External Inspection

1. Prior to demounting, inspect the tire surface, the valve and the wheel for the source of the leak by using a water and soap solution. Mark the injured area and totally deflate the tire by removing the valve core.
2. Demount the tire from the wheel and place the tire on a well-lighted spreader.

Internal Inspection

Fig. 15: Marking Tire Puncture Location

Courtesy of GENERAL MOTORS COMPANY

1. Spread the beads and mark the puncture with a tire crayon.
2. Inspect the inner tire for any signs of internal damage.
3. Remove the puncturing object, noting the direction of the penetration.
4. Probe the injury with a blunt awl in order to determine the extent and direction of the injury.
5. Remove any loose foreign material from the injury.
6. Punctures exceeding 6.35 mm (1/4 in) should not be repaired.

Cleaning

Fig. 16: Cleaning Repair Area

Courtesy of GENERAL MOTORS COMPANY

1. Clean the area around the puncture thoroughly with a proper liner cleaner, clean cloth and a scraper. This step serves to remove dirt and mold lubricants to insure proper adhesion and non-contamination of the buffing tool.
2. Refer to information on the product or manufacturer's Material Safety Data Sheet and follow guidelines for handling and disposal.

Clean the Injury Channel

Fig. 17: Reaming Puncture Channel

Courtesy of GENERAL MOTORS COMPANY

1. Use a proper hand reamer, carbide cutter or drill bit to ream the puncture channel from the inside of the tire in order to clean the injury.
2. Remove steel wires protruding above the liner surface to prevent damage to the repair unit.
3. Consult your repair material supplier for recommended reaming tool(s).

Fill the Injury

Fig. 18: Filling Injury Location

Courtesy of GENERAL MOTORS COMPANY

1. It is necessary to fill the injury channel to provide back up for the repair unit and to prevent moisture from entering the tire fabric and steel wires.
2. For combination repair/plug units skip this step. Cement the injured channel and fill the injury from the inside of the tire with the repair plug per repair material manufacturer's recommendations. Without stretching the plug, cut the plug off just above the inside tire surface.
3. Consult your repair material supplier for proper repair material selection.

Repair Unit Selection

Fig. 19: Outlining Tire Injury Area

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not install the repair unit in this step.

1. Center the repair unit over the injury as a reference and outline an area larger than the unit so that buffing will not remove the crayon marks.
2. Remove the repair unit.
3. DO NOT overlap previous or multiple repair units.
4. Consult your repair material supplier for proper repair unit selection.

Buffing

Fig. 20: Buffing Within Marked Area

Courtesy of GENERAL MOTORS COMPANY

1. To prevent contamination and preserve the outline, buff within the marked area thoroughly and evenly with a low speed buffing tool using a fine wire brush or gritted rasp.
2. Buff to a smooth velvet surface (RMA #1 or #2 buffed texture).
3. Use caution not to gouge the inner liner or expose casing fabric.
4. Remove any buffing dust with a vacuum cleaner.
5. Consult your repair material supplier for a proper buffing tool.

Cementing

Fig. 21: Applying Chemical Cement

Courtesy of GENERAL MOTORS COMPANY

Apply chemical cement according to the repair material manufacturer's procedures.

Repair Unit Application

Fig. 22: Installing Repair Unit

Courtesy of GENERAL MOTORS COMPANY

The tire must be in the relaxed position when the repair unit is installed. Do not spread the beads excessively.

Two-Piece Plug and Repair Units

1. If applicable, install the repair unit so that the alignment is correct.
2. Center the repair unit over the injury and stitch down thoroughly with the stitching tool, working from the center out.

Fig. 23: Cutting Plug Material

Courtesy of GENERAL MOTORS COMPANY

3. Being careful not to stretch the plug material, cut the plug flush with the outer tread.

Combination Repair/Plug Units

1. Pull the plug through the injury until the repair just reaches the liner. Stitch down thoroughly.
2. Follow the repair material manufacturer's recommendations for further installation instructions.

Consult your repair material supplier for the proper stitching tool.

Safety Cage

Fig. 24: Identifying Safety Cage

Courtesy of GENERAL MOTORS COMPANY

Some run flat tires and high performance tires may require more than 275 kPa (40 psi) to seat the bead. In such a case, a tire safety cage must be used. Consult the tire manufacturer for its individual repair policy.

Final Inspection

Fig. 25: Performing Final Inspection

Courtesy of GENERAL MOTORS COMPANY

1. After remounting and inflating the tire, check both beads, the repair and the valve with a water and soap solution in order to detect leaks.
2. If the tire continues to lose air, the tire must be demounted and reinspected.
3. Balance the tire and wheel assembly. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle** .

For additional tire puncture repair information, contact:

Rubber Manufacturers Association (RMA)

1400 K Street, N.W., Suite 900

Washington

DC

20005-2403

Telephone: 202-682-4800

E-mail: info@rma.org

Website: www.rma.org

TIRE DISMOUNTING AND MOUNTING

CAUTION: Use a tire changing machine in order to dismount tires. Do not use hand tools or tire irons alone in order to remove the tire from the wheel. Damage to the tire beads or the wheel rim could result.

CAUTION: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

CAUTION: Damage to either the tire bead or the wheel mounting holes can result from the use of improper wheel attachment or tire mounting procedures. It takes up to 70 seconds for all of the air to completely exhaust from a large tire. Failure to follow the proper procedures could cause the tire changer to put enough force on the tire to bend the wheel at the mounting surface. Such damage may result in vibration and/or shimmy, and under severe usage lead to wheel cracking.

1. Remove the valve core from the valve stem.
2. Deflate the tire completely.

NOTE: Rim-clamp European-type tire changers are recommended.

3. Use the tire changer in order to remove the tire from the wheel. Follow steps 4 - 7 to remove the tire from the wheel.

Fig. 26: Tire Changer

Courtesy of GENERAL MOTORS COMPANY

4. When separating the tire bead from the wheel, position the bead breaking fixture 90, 180 and 270 degrees from the valve stem.

CAUTION: Failure to position valve stem in proper position while dismounting and mounting the tire may result in the TPM sensor to become damaged.

5. Position the wheel and tire so the valve stem is at the 7 o'clock position relative to the head. Apply tire bead lubricant to the pry bar to prevent damage to the tire bead. The tire iron or pry bar can be inserted when prying the outer tire bead up and over the mounting/dismounting head.

Fig. 27: Separating Tire Bead from Wheel

Courtesy of GENERAL MOTORS COMPANY

6. Position the wheel and tire so the valve stem is again at the 7 o'clock position relative to the head. The tire iron or pry bar can be inserted when prying the inner tire bead up and over the mounting/dismounting head.
7. Remove all residual liquid sealant from the inside of the tire and wheel surfaces. If any tire sealant is noted upon tire dismounting on vehicles equipped with TPM, replace the tire pressure sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#).
8. Use medium coarseness steel wool in order to remove any rubber, light rust or corrosion from the wheel bead seats.

CAUTION: When mounting the tires, use an approved tire mounting lubricant. **DO NOT** use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A silicon base compound can cause the tire to slip on the rim. A corrosive type compound can cause tire or rim deterioration.

9. Apply mounting lubricant to the tire bead and the wheel rim. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

Fig. 28: Position Rim So Valve Stem Is At 7 O'clock Position Relative To Head

Courtesy of GENERAL MOTORS COMPANY

10. Position the rim so the valve stem (1) is at the 7 o'clock position relative to the head (2). This will protect the sensor when the bottom bead seats.

Fig. 29: Ensure Valve Stem Is At 7 O'clock Position

Courtesy of GENERAL MOTORS COMPANY

11. Using the tire machine, rotate the tire/wheel assembly clockwise when transferring the tire bead to the inside of the wheel rim. Ensure that the valve stem (1) is at the 7 o'clock position.

Fig. 30: Reposition Wheel And Tire So Valve Stem Is At 7 O'clock Position Relative To Head
Courtesy of GENERAL MOTORS COMPANY

12. After the bottom bead is on the wheel, reposition the wheel and tire so that the valve stem (1) is at the 7 o'clock position relative to the head. This will protect the sensor while mounting the tire bead to the outside of the wheel.

Fig. 31: Using Tire Changer

Courtesy of GENERAL MOTORS COMPANY

13. Use the tire changer in order to install the tire to the wheel.

WARNING: To avoid serious personal injury, do not stand over tire when inflating. The bead may break when the bead snaps over the safety hump. Do not exceed 275 kPa (40 psi) pressure when inflating any tire if beads are not seated. If 275 kPa (40 psi) pressure will not seat the beads, deflate, relubricate the beads and reinflate. Overinflation may cause the bead to break and cause serious personal injury.

14. Inflate the tire until it passes the bead humps. Be sure that the valve core is not installed at this time.

15. Install the valve core to the valve core stem.

16. Inflate the tire to the proper air pressure.

17. Ensure that the locating rings are visible on both sides of the tire in order to verify that the tire bead is fully seated on the wheel.

TIRE ROTATION

Rotate the tire and wheel assemblies at frequent intervals to equalize wear. Refer to [Maintenance Schedule](#) . In addition to scheduled rotation, rotate the tire and wheel assembly whenever uneven tire wear is noticed.

Radial tires tend to wear faster in the shoulder area, particularly in front positions. Radial tires in non-drive locations may develop an irregular wear pattern that may increase tire noise. This makes regular rotation especially necessary.

Refer to [Tire and Wheel Removal and Installation](#).

Fig. 32: Identifying Tire Rotation Pattern

Courtesy of GENERAL MOTORS COMPANY

Always use a 4-wheel rotation. After rotation, check the wheel nuts for specified torque. Then set the tire pressure.

TIRE AND WHEEL BALANCING

WARNING: Failure to adhere to the following precautions before tire balancing can result in personal injury or damage to components:

- Clean away any dirt or deposits from the inside of the wheels.
- Remove any stones from the tread.
- Wear eye protection.
- Use coated weights on aluminum wheels.

Tire and Wheel Assembly Balancer Calibration

Tire and wheel balancers can drift out of calibration over time, or can become inaccurate as a result of heavy use. There will likely not be any visual evidence that a calibration problem exists. If a balancer is not calibrated within specifications, and a tire and wheel assembly is balanced on that machine, the assembly may actually be imbalanced.

Tire and wheel assembly balancer calibration should be checked approximately every 2 weeks, if the machine is used frequently, and/or whenever the balance readings are questionable.

Tire and Wheel Assembly Balancer Calibration Test

NOTE: If the balancer fails any of the steps in this calibration test, the balancer should be calibrated according to the manufacturer's instructions. If the balancer cannot be calibrated, contact the manufacturer for assistance.

Inspect the calibration of the tire and wheel assembly balancer according to the manufacturer's recommendations, or perform the following test.

Fig. 33: View Of Tire & Wheel Assembly Balancer

Courtesy of GENERAL MOTORS COMPANY

1. Spin the balancer without a wheel or any of the adapters on the shaft.
2. Inspect the balancer readings.

Specification

Zero within 7 g (1/4 oz)

3. If the balancer is within the specification range, balance a tire and wheel assembly - that is within radial and lateral runout tolerances - to ZERO, using the same balancer.
4. After the tire and wheel assembly has been balanced, add an 85 g (3 oz) test weight to the wheel at any location.
5. Spin the tire and wheel assembly again. Note the readings.
 - In the static and dynamic modes, the balancer should call for 85 g (3 oz) of weight, 180 degrees opposite the test weight.
 - In the dynamic mode, the weight should be called for on the flange of the wheel opposite the test weight.

6. With the assembly imbalanced to 85 g (3 oz), cycle the balancer 5 times.

7. Inspect the balancer readings:

Specification

Maximum variation: 7 g (1/4 oz)

8. Index the tire and wheel assembly on the balancer shaft, 90 degrees from the previous location.

9. Cycle the balancer with the assembly at the new location.

10. Inspect the balancer readings:

Specification

Maximum variation: 7 g (1/4 oz)

11. Repeat steps 8 through 10 until the tire and wheel assembly has been cycled and checked at each of the 4 locations on the balancer shaft.

Tire and Wheel Assembly Balancing Guidelines

NOTE: Tire and wheel assemblies which exhibit excessive runout can produce vibrations even if the assemblies are balanced.

It is strongly recommended that the tire and wheel assembly runout be measured and corrected if necessary BEFORE the assemblies are balanced.

If the runout of the tire and wheel assemblies has not yet been measured, refer to [**Tire and Wheel Assembly Runout Measurement - Off Vehicle**](#) before proceeding.

There are 2 types of tire and wheel balance:

Static Balance

Fig. 34: View Of Static Balance

Courtesy of GENERAL MOTORS COMPANY

Static balance is the equal distribution of weight around the wheel circumference. The wheel balance weights (2) are positioned on the wheel in order to offset the effects of a heavy spot (3). Wheels that have static imbalance can produce a bouncing action called tramp.

Dynamic Balance

Fig. 35: View Of Dynamic Balance

Courtesy of GENERAL MOTORS COMPANY

Dynamic balance is the equal distribution of weight on each side of the tire and wheel assembly centerline. The wheel balance weights (2) are positioned on the wheel in order to offset the effects of a heavy spot (3). Wheels that have dynamic imbalance have a tendency to move from side to side and can cause an action called shimmy.

Most off-vehicle balancers are capable of checking both types of balance simultaneously.

As a general rule, most vehicles are more sensitive to static imbalance than to dynamic imbalance; however, vehicles equipped with low profile, wide tread path, high performance tires and wheels are susceptible to small amounts of dynamic imbalance. As little as 14 - 21 g (1/2 - 3/4 oz) imbalance is capable of inducing a vibration in some vehicle models.

Balancing Procedure

NOTE: When balancing tire and wheel assemblies, use a known good, recently calibrated, off-vehicle, two-plane dynamic balancer set to the finest balance mode available.

Fig. 36: Wheel Balancer Center Cone

Courtesy of GENERAL MOTORS COMPANY

NOTE: Carefully follow the wheel balancer manufacturers's instructions for proper mounting of the center cone (1).

1. Raise and support the vehicle. [Lifting and Jacking the Vehicle](#)
2. Mark the location of the wheels to the wheel studs and mark the specific vehicle position on each tire and wheel - LF, LR, RF, RR.
3. Remove the tire and wheel assemblies one at a time and mount on a spin-type wheel balancer. [Tire and Wheel Removal and Installation](#)
4. Carefully follow the wheel balancer manufacturer's instructions for proper mounting techniques to be used on different types of wheels.

Regard aftermarket wheels, especially those incorporating universal lug patterns, as potential sources of runout and mounting concerns.

5. Be sure to use the correct type of wheel balance weights for the type of wheel rim being balanced. Be sure to use the correct type of coated wheel balance weights on aluminum wheels. Refer to Wheel Weight

Usage.

6. Balance all four tire and wheel assemblies as close to zero as possible.
7. Using the matchmarks made prior to removal, install the tire and wheel assemblies to the vehicle. **Tire and Wheel Removal and Installation**
8. Lower the vehicle.

Wheel Weight Usage

Tire and wheel assemblies can be balanced using either the static or dynamic method.

Clip-on Weights

1

4

2

3

Fig. 37: Identifying Clip-On Wheel Weight Types

Courtesy of GENERAL MOTORS COMPANY

NOTE:

When balancing factory aluminum wheels with clip-on wheel balance weights, be sure to use special polyester-coated weights. These coated weights reduce the potential for corrosion and damage to aluminum wheels.

These coated weights reduce the potential for corrosion and damage to aluminum wheels.

- MC (1) and AW (2) series weights are approved for use on aluminum wheels.
- P (3) series weights are approved for use on steel wheels only.
- T (4) series coated weights are approved for use on both steel and aluminum wheels.

Fig. 38: Attaching Clip-On Wheel Weight

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a nylon or plastic-tipped hammer when installing coated clip-on wheel balance weights to minimize the possibility of damage to the polyester coating.

The contour and style of the wheel rim flange will determine which type of clip-on wheel weight (1) should be used. The weight should follow the contour of the rim flange. The weight clip should firmly grip the rim flange.

Wheel Weight Placement - Clip-on Weights

Fig. 39: Clip-On Weight Placement

Courtesy of GENERAL MOTORS COMPANY

When static balancing, locate the wheel balance weights on the inboard flange (2) if only 28 g (1 oz) or less is called for. If more than 28 g (1 oz) is called for, split the weights as equally as possible between the inboard (2) and outboard (1) flanges.

When dynamic balancing, locate the wheel balance weights on the inboard (2) and outboard (1) rim flanges at the positions specified by the wheel balancer.

Adhesive Weights

Fig. 40: Identifying Adhesive Weight Wheel Placement

Courtesy of GENERAL MOTORS COMPANY

NOTE: When installing adhesive balance weights on flangeless wheels, do NOT install the weight on the outboard surface of the rim.

Adhesive wheel balance weights may be used on factory aluminum wheels. Perform the following procedure to

install adhesive wheel balance weights.

1. Determine the correct areas for placement of the wheel weights on the wheel.
 - When static balancing, locate the wheel balance weights along the wheel centerline (1) on the inner wheel surface if only 28 g (1 oz) or less is called for. If more than 28 g (1 oz) is called for, split the weights as equally as possible between the wheel centerline and the inboard edge of the inner wheel surface (2).
 - When dynamic balancing, locate the wheel balance weights along the wheel centerline and the inboard edge of the inner wheel surface (2) at the positions specified by the wheel balancer.
2. Ensure that there is sufficient clearance between the wheel weights and brake system components.

NOTE: Do not use abrasives to clean any surface of the wheel.

3. Using a clean cloth or paper towel with a general purpose cleaner, thoroughly clean the designated balance weight attachment areas of any corrosion, overspray, dirt or any other foreign material.
4. To ensure there is no remaining residue, wipe the balance weight attachment areas again, using a clean cloth or paper towel with a mixture of half isopropyl alcohol and half water.
5. Dry the attachment areas with hot air until the wheel surface is warm to the touch.
6. Warm the adhesive backing on the wheel balance weights to room temperature.
7. Remove the protective covering from the adhesive backing on the back of the balance weights. DO NOT touch the adhesive surface.
8. Apply the wheel balance weights to the wheel, press into place with hand pressure.
9. Secure the wheel balance weights to the wheel with a 90 N (21 lb) force applied with a roller.

DESCRIPTION AND OPERATION

ALL SEASONS TIRES DESCRIPTION

Fig. 41: Identifying All Seasons Tire Marking

Courtesy of GENERAL MOTORS COMPANY

Most GM vehicles are equipped with steel belted all-season radial tires as standard equipment. These tires qualify as snow tires, with a higher than average rating for snow traction than the non-all season radial tires previously used. Other performance areas, such as wet traction, rolling resistance, tread life, and air retention, are also improved. This is done by improvements in both tread design and tread compounds. These tires are identified by an M + S molded in the tire side wall after the tire size. The suffix MS is also molded in the tire side wall after the TPC specification number.

The optional handling tires used on some vehicles now also have the MS marking after the tire size and the TPC specification number.

GENERAL DESCRIPTION

The factory installed tires are designed to operate satisfactorily with loads up to and including the full rated load capacity when these tires are inflated to the recommended pressures.

The following factors have an important influence on tire life:

- Correct tire pressures
- Correct wheel alignment
- Proper driving techniques
- Tire rotation

The following factors increase tire wear:

- Heavy cornering
- Excessively rapid acceleration
- Heavy braking

METRIC WHEEL NUTS AND BOLTS DESCRIPTION

Metric wheel/nuts and bolts are identified in the following way:

- The wheel/nut has the word Metric stamped on the face.
- The letter M is stamped on the end of the wheel bolt.

The thread sizes of metric wheel/nuts and the bolts are indicated by the following example: M12 x 1.5.

- M = Metric
- 12 = Diameter in millimeters
- 1.5 = Millimeters gap per thread

P-METRIC SIZED TIRES DESCRIPTION

Fig. 42: Identifying P-Metric Sized Tire Marking
Courtesy of GENERAL MOTORS COMPANY

Most P-metric tire sizes do not have exact corresponding alphanumeric tire sizes. Replacement tires should be of the same tire performance criteria TPC specification number including the same size, the same load range, and the same construction as those originally installed on the vehicle. Consult a tire dealer if you must replace the P-metric tire with other sizes. Tire companies can best recommend the closest match of alphanumeric to

P-metric sizes within their own tire lines. The above illustration may not correspond with your vehicle, but is meant as an example.

REPLACEMENT WHEELS DESCRIPTION

Replace the wheel if any of the following conditions exist:

- The wheel exhibits excessive runout.
- The wheel is bent.
- The wheel is cracked.
- The wheel is severely rusted.
- The wheel is severely corroded.

NOTE: Air leaks caused by porosity on aluminum wheels are repairable.

- The wheel leaks air.

WARNING: If you are replacing the wheel(s), the wheel stud(s), the wheel nut(s) or the wheel bolt(s), install only new GM original equipment parts. Installation of used parts or non-GM original equipment parts may cause the wheel to loosen, loss of tire air pressure, poor vehicle handling and loss of vehicle control resulting in personal injury.

CAUTION: The use of non-GM original equipment wheels may cause:

- Damage to the wheel bearing, the wheel fasteners and the wheel
- Tire damage caused by the modified clearance to the adjacent vehicle components
- Adverse vehicle steering stability caused by the modified scrub radius
- Damage to the vehicle caused by the modified ground clearance
- Speedometer and odometer inaccuracy

Replace the wheel, the wheel studs and the wheel/nuts, or the wheel bolts if applicable, if any of the following conditions exist:

- The wheel has elongated bolt holes.
- The wheel/nuts, or bolts if applicable, loosen repeatedly.

Steel wheel identification is stamped into the wheel near the valve stem.

Aluminum wheel identification is cast into the inboard side of the wheel.

TIRE INFLATION DESCRIPTION

This vehicle has been engineered to operate up to the stated load capacity with wheel and tire assemblies of the type, size, construction, and configuration as originally installed. Maintenance of the tire inflation pressures is critical to the continued satisfactory performance, handling, and operating economy of the vehicle. Operation

with incorrectly or improperly inflated tires can adversely affect vehicle performance and may contribute to the following:

- Reduced fuel economy
- Tire overloading
- Shortened tire life
- Excessive tire wear
- Uneven tire wear
- Vehicle handling concerns

Inspect the tire pressures when the vehicle has not been driven for at least 3 hours or not more than 1.6 km (1 mi) and when the tires are cool to the touch.

Tire inflation pressures should be inspected monthly and before an extended trip and adjusted to meet the specifications listed for the particular vehicle. Replace any missing or damaged tire valve stem extensions and/or caps to prevent the intrusion of water and contaminants.

One pound per square inch (psi) equals 6.9 kilopascals (kPa). The following table illustrates the conversion of kilopascals to pounds per square inch:

Inflation Pressure Conversion (Kilopascals to PSI)

kPa	psi	kPa	psi
140	20	215	31
145	21	220	32
155	22	230	33
160	23	235	34
165	24	240	35
170	25	250	36
180	26	275	40
185	27	310	45
190	28	345	50
200	29	380	55
205	30	415	60
Conversion: 6.9 kPa = 1 psi			

For the correct inflation pressures refer to the vehicle's Tire Placard.

Tires inflated to a higher than recommended pressure can contribute to the following conditions:

- A hard ride
- Tire bruising
- Rapid tread wear at the center of the tire

Tires inflated to a lower than recommended pressure can contribute to the following conditions:

- Tire squeal on turns

- Hard steering
- Rapid and/or uneven wear on the outer edges of the tread
- Tire rim bruises and tire rim rupture
- Tire cord breakage
- High tire temperatures
- Sluggish vehicle handling
- Higher fuel consumption

Unequal pressure on the same axle can cause the following conditions:

- Uneven braking action
- Steering lead
- Imprecise vehicle handling

TREAD WEAR INDICATORS DESCRIPTION

Fig. 43: View Of Tread Wear Indicators

Courtesy of GENERAL MOTORS COMPANY

The original equipment tires have tread wear indicators that show when you should replace the tires.

The location of these indicators are at 60 degree intervals around the outer diameter of the tire. The indicators appear as a 6 mm (0.25 in) wide band when the tire tread depth becomes 1.6 mm (2/32 in).

SUSPENSION

Wheel Alignment - Volt

SPECIFICATIONS

WHEEL ALIGNMENT SPECIFICATIONS

NOTE: All specifications are in degrees, convert to angular minutes, if necessary.

Conversion

- 1.00 degree = 60 angular minutes
- 0.75 degrees = 45 angular minutes
- 0.50 degrees = 30 angular minutes
- 0.25 degrees = 15 angular minutes
- 1.00 angular minute = 60 angular seconds

Example

0.14 degrees *	60 angular minutes / degree =	8.40 angular minutes
0.40 angular / minutes *	60 angular seconds / angular minute =	24.00 angular seconds
NOTE: Angular seconds up to 30 are rounded off, angular seconds beyond are rounded up to 60 angular seconds.		
24.00 angular seconds ->	0 angular seconds =	0.00 angular minute
0.14 degrees =	8.40 angular minutes =	8.00 angular minutes
Condition: Full tank, no passengers and placed on plane ground.

REPAIR INSTRUCTIONS

STEERING WHEEL ALIGNMENT

A steering wheel that is off center is not always the result of improper steering wheel alignment. One possible cause is tire lead due to worn or improperly manufactured tires. Lead is the vehicle deviation from a straight path on a level road without pressure on the steering wheel. Refer to [Radial Tire Lead/Pull Correction](#) in order to determine if the vehicle has a tire lead problem. Before aligning the steering wheel the vehicle alignment must also be correct.

Before performing any adjustment affecting wheel alignment, perform the following inspections and adjustments in order to ensure correct alignment :

- Inspect the tires for the proper inflation and irregular tire wear. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#) , and [Tire Diagnosis - Irregular or Premature Wear](#) .
- Inspect the steering gear for looseness at the frame. Refer to [Fastener Specifications](#) .
- Inspect the steering wheel for excessive drag or poor return due to stiff or rusted linkage or suspension components.

Perform the following steps in order to perform steering wheel alignment adjustment:

1. Tires must be in the straight ahead position.
2. It maybe necessary to have an assistant hold the steering so it does not rotate freely once the steering shaft is disconnected on a vehicle equipped with an SIR system.
3. Disconnect the steering shaft from the steering gear. Refer to [Intermediate Steering Shaft Replacement](#) .
4. Rotate the intermediate shaft until the steering wheel is visually straight. If the steering wheel is out over a half turn check for other damage on the vehicle.
5. Reconnect the steering shaft to the steering gear. Refer to [Intermediate Steering Shaft Replacement](#) .
6. Verify that the steering wheel is straight.

WHEEL ALIGNMENT MEASUREMENT

Steering and vibration complaints are not always the result of improper alignment. One possible cause is wheel and tire imbalance. Another possibility is tire lead due to worn or improperly manufactured tires. Lead/pull is defined as follows: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path. Lead is the vehicle deviation from a straight path on a level road without pressure on the steering wheel. Refer to [Radial Tire Lead/Pull Correction](#) in order to determine if the vehicle has a tire lead problem.

Before performing any adjustment affecting wheel alignment, perform the following inspections in order to ensure correct alignment readings:

- Inspect for visible damage to the suspension components and replace as necessary.
- Inspect the tires for the proper inflation and irregular tire wear. Refer to [Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label](#) , and [Tire Diagnosis - Irregular or Premature Wear](#) .
- Inspect the runout of the wheels and the tires. Refer to [Tire and Wheel Runout Specifications](#) .
- Inspect the wheel bearings for backlash and excessive play. Refer to [Wheel Bearings Diagnosis](#) .
- Inspect the ball joints for looseness or wear.
- Inspect the tie rod ends for looseness or wear.
- Inspect the control arms and stabilizer shaft for looseness or wear.
- Inspect the steering gear for looseness at the frame. Refer to [Fastener Specifications](#) .
- Inspect the struts/shock absorbers for wear, leaks, and any noticeable noises. Refer to [Strut and Shock Absorber Inspection](#) , for front and [Strut and Shock Absorber Inspection](#) for rear.
- Inspect the vehicle trim height. Refer to [Trim Height Inspection](#) .
- Inspect the steering wheel for excessive drag or poor return due to stiff or rusted linkage or suspension components.
- Inspect the fuel level. The fuel tank should be full or the vehicle should have a compensating load added.

Give consideration to excess loads, such as tool boxes, sample cases, etc. If normally carried in the vehicle, these items should remain in the vehicle during alignment adjustments. Give consideration also to the condition of the equipment being used for the alignment. Follow the equipment manufacturer's instructions.

Satisfactory vehicle operation may occur over a wide range of alignment settings. However, if the setting exceeds the service allowable specifications, correct the alignment to the service preferred specifications. Refer to [Wheel Alignment Specifications](#).

Perform the following steps in order to measure the front and rear alignment angles:

1. Install the alignment equipment according to the manufacturer's instructions.
2. Jounce the front and the rear bumpers 3 times prior to checking the wheel alignment.
3. Measure the alignment angles and record the readings.

NOTE:

- Record the "Before" and "After" alignment measurements.
- When performing adjustments to vehicles requiring a 4-wheel alignment, set the rear toe adjustment first in order to obtain proper front alignment angles.

4. Adjust alignment angles to vehicle specification, if necessary. Refer to [Wheel Alignment Specifications](#).

FRONT CAMBER ADJUSTMENT

Fig. 1: Front Camber Adjustment Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE:

A Service Bolt is available for the lower strut to steering knuckle position. Do not attempt to file on the strut to make camber adjustment. The service bolt is approximately 2 mm smaller in diameter to allow adjustment. Refer to the electronic parts catalog for proper application.

1. If the front camber is out of specifications, perform the following:
 - Remove the top front strut to steering knuckle nut (2) and the bolt (1). DISCARD the bolt.
 - Replace the top front strut to steering knuckle bolt (1) with the service bolt. (No spines or knurls)
Do not fully tighten the nut.

- Loosen the nut (3) on the bottom bolt (4) enough to allow the strut to move.
 - Adjust the front camber to specifications. [Wheel Alignment Specifications](#)
2. Tighten the top front strut nut (2). [Strut Assembly Removal and Installation](#)
 3. Remove the bottom front strut to steering knuckle nut (3) and the bolt (4). DISCARD the bolt.
 4. Replace the bottom front strut to steering knuckle bolt. Install a NEW splined/knurled bolt.
 5. Tighten the bottom front strut nut. [Strut Assembly Removal and Installation](#)

WHEEL ALIGNMENT - STEERING WHEEL ANGLE AND/OR FRONT TOE ADJUSTMENT

Fig. 2: View Of Tie Rod Jam Nut & Adjuster
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Before performing any adjustments affecting the wheel alignment, refer to [Wheel Alignment Measurement](#).

1. Ensure that the steering wheel is set in a straight ahead position and centered.
2. Loosen the tie rod nut (5).
3. Adjust the toe to specification. Refer to [Wheel Alignment Specifications](#)

CAUTION: Refer to [Fastener Caution](#) .

4. Tighten the tie rod nut (5).

Tighten

Tighten the tie rod nut (5) to 60 N.m (44 lb ft).

REAR CAMBER ADJUSTMENT

The rear camber is not adjustable. If the rear camber angle is not within specifications, inspect for suspension support misalignment or rear suspension damage. Replace any damaged suspension components as necessary.

REAR TOE ADJUSTMENT

The rear toe is not adjustable. If the rear toe angle is not within specifications, inspect for suspension support misalignment or rear suspension damage. Replace any damaged suspension components as necessary.

DESCRIPTION AND OPERATION

CAMBER DESCRIPTION

Fig. 3: Illustrating Camber Angle

Courtesy of GENERAL MOTORS COMPANY

Camber is the tilting of the wheels from the vertical when viewed from the front of the vehicle. When the wheels tilt outward at the top, the camber is positive (+). When the wheel tilts inward at the top, the camber is negative (-). The amount of tilt is measured in degrees from the vertical. Camber settings influence the directional control and the tire wear.

Too much positive camber will result in premature wear on the outside of the tire and cause excessive wear on the suspension parts.

Too much negative camber will result in premature wear on the inside of the tire and cause excessive wear on the suspension parts.

Unequal side-to-side camber of 1 degree or more will cause the vehicle to pull or lead to the side with the most positive camber.

Cross Camber is the difference between the left camber value and the right camber value.

Cross Camber = L camber - R camber

CASTER DESCRIPTION

Fig. 4: Illustrating Caster Angle

Courtesy of **GENERAL MOTORS COMPANY**

Caster is the tilting of the uppermost point of the steering axis either forward or backward, when viewed from the side of the vehicle. A backward tilt is positive (+) and a forward tilt is negative (-). Caster influences directional control of the steering but does not affect the tire wear. Caster is affected by the vehicle height, therefore it is important to keep the body at its designed height. Overloading the vehicle or a weak or sagging rear spring will affect caster. When the rear of the vehicle is lower than its designated trim height, the front suspension moves to a more positive caster. If the rear of the vehicle is higher than its designated trim height, the front suspension moves to a less positive caster.

With too little positive caster, steering may be touchy at high speed and wheel returnability may be diminished when coming out of a turn. If one wheel has more positive caster than the other, that wheel will pull toward the center of the vehicle. This condition will cause the vehicle to pull or lead to the side with the least amount of positive caster.

Cross Caster is the difference between the left caster value and the right caster value.

Cross caster = L caster - R caster

LEAD/PULL DESCRIPTION

At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path.

IMPORTANT: Vehicles will tend to lead/pull in the direction of the road slope as part of normal operation.

Lead/pull is usually caused by the following factors:

- Road slope
- Variability in tire construction
- Wheel alignment (front cross caster and camber)
- Unbalanced steering gear
- Electronic Power Steering (EPS) steering position and torque sensors not calibrated correctly, if equipped.

MEMORY STEER DESCRIPTION

Memory steer is when the vehicle wants to lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.

SCRUB RADIUS DESCRIPTION

Ideally, the scrub radius is as small as possible. Normally, the SAI angle and the centerline of the tire and the wheel intersect below the road surface, causing a positive scrub radius. With struts, the SAI angle is much larger than the long arm/short arm type of suspension. This allows the SAI angle to intersect the camber angle above the road surface, forming a negative scrub radius. The smaller the scrub radius, the better the directional stability. Installing aftermarket wheels that have additional offset will dramatically increase the scrub radius. The newly installed wheels may cause the centerline of the tires to move further away from the spindle. This will increase the scrub radius.

A large amount of scrub radius can cause severe shimmy after hitting a bump. Four-wheel drive vehicles with large tires use a steering damper to compensate for an increased scrub radius. Scrub radius is not directly measurable by the conventional methods. Scrub radius is projected geometrically by engineers during the design phase of the suspension.

THRUST ANGLES DESCRIPTION

Fig. 5: Illustrating Thrust Angles

Courtesy of GENERAL MOTORS COMPANY

The front wheels aim or steer the vehicle. The rear wheels control tracking. This tracking action relates to the thrust angle (3). The thrust angle is the path that the rear wheels take. Ideally, the thrust angle is geometrically aligned with the body centerline (2).

In the illustration, toe-in is shown on the left rear wheel, moving the thrust line (1) off center. The resulting deviation from the centerline is the thrust angle.

If the thrust angle is not set properly the vehicle may "dog track", the steering wheel may not be centered or it could be perceived as a bent axle. Thrust angle can be checked during a wheel alignment.

Positive thrust angle means the thrust line is pointing to the right hand side (RHS) of the vehicle.

Negative thrust angle means the thrust line is pointing to the left hand side (LHS) of the vehicle.

If the thrust angle is out of specification, moving the axle to body relationship will change the thrust angle reading.

If the vehicle is out in the Positive (+) direction-moving the RHS forward and/or LHS rearward will move the thrust angle towards zero degrees.

If the vehicle is out in the Negative (-) direction-moving the RHS rearward and/or LHS forward will move the thrust angle towards zero degrees.

TOE DESCRIPTION

Fig. 6: Illustrating Toe Angle

Courtesy of GENERAL MOTORS COMPANY

Toe is a measurement of how much the front and/or rear wheels are turned in or out from a straight-ahead position. When the wheels are turned in, toe is positive (+). When the wheels are turned out, toe is negative (-). The actual amount of toe is normally only a fraction of a degree. The purpose of toe is to ensure that the wheels roll parallel.

Toe also offsets the small deflections of the wheel support system that occur when the vehicle is rolling forward. In other words, with the vehicle standing still and the wheels set with toe-in, the wheels tend to roll parallel on the road when the vehicle is moving.

Improper toe adjustment will cause premature tire wear and cause steering instability.

TORQUE STEER DESCRIPTION

Fig. 7: Identifying Torque Steer

Courtesy of **GENERAL MOTORS COMPANY**

A vehicle pulls or leads in one direction during hard acceleration. A vehicle pulls or leads in the other direction during deceleration.

The following factors may cause torque steer to be more apparent on a particular vehicle:

- A slightly smaller diameter tire on the right front increases a right torque lead. Inspect the front tires for differences in the brand, the construction, or the size. If the tires appear to be similar, change the front tires from side-to-side and retest the vehicle. Tire and wheel assemblies have the most significant effect on torque steer correction.
- A large difference in the right and left front tire pressure
- Left-to-right differences in the front view axle angle may cause significant steering pull in a vehicle. The pull will be to the side with the most downward sloping axle from the differential to the wheels. Axles

typically slope downward from the differential. The slope of the transaxle pan to level ground may be used as an indication of bias axle angles. The side with the higher transaxle pan (shown on the left side of the illustration) has the most downward sloping axle angle.

WANDER DESCRIPTION

Wander is the undesired drifting or deviation of a vehicle to either side from a straight path with hand pressure on the steering wheel. Wander is a symptom of the vehicle's sensitivity to external disturbances, such as road crown and crosswind, and accentuated by poor on-center steering feel.

TRANSMISSION GENERAL SPECIFICATIONS

Name	5ET50
RPO Codes	MKV
Production Location	Warren, Michigan
Transmission Drive	Front Wheel Drive Transaxle
One-Motor EV Drive (CD)	Motor-Generator B provide or absorb vehicle torque for electric only
Two-Motor EV Drive (CD)	Motor-Generator B and Motor-Generator A combine to provide or absorb vehicle torque for electric only

Name	5ET50
	operation
Extended Range Low (Mode 1) (CS)	Online optimizer balances engine, Motor-Generator A, and Motor-Generator B, to achieve the most efficient vehicle operation at lower vehicle speeds
Extended Range High (Mode 2) (CS)	Online optimizer balances engine, Motor-Generator A, and Motor-Generator B, to achieve the most efficient vehicle operation at higher vehicle speeds
Fixed Ratio Extended Range (CS)	Motor/Generator B will be able to electrically boost or regenerate the vehicle torque in parallel with the engine torque. Motor/Generator A is locked to the case and not contribute to torque
Pressure Tap	Line Pressure
Transmission Fluid Type	DEXRON VI®
Transmission Type: Electric	Electrically Variable
Transmission Type: EV	MKV: 48 kW (Drive Motor A (1) and 87 kW (Drive Motor B (2) Internal Motor
Transmission Type: T	Transaxle Mount
Transmission Type: 50	Product Series
Position Quadrant	P, R, N, D, L
Case Material	Die Cast Aluminum
Transmission Net Weight (Wet)	119 kg (262 pounds)
Maximum Trailer Towing Capacity	MKV: N/A

ADHESIVES, FLUIDS, LUBRICANTS, AND SEALERS

Application	Type of Material	GM Part Number

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0658 OR P0659: ACTUATOR HIGH CONTROL CIRCUIT GROUP 1 VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0658

Actuator High Control Circuit Group 1 Low Voltage

DTC P0659

Actuator High Control Circuit Group 1 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P0658	P0659	P0659	-

Typical Scan Tool Data

High Side Drive 1

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition On Parameter Normal Range: On			
High Side Driver 1	Off	On	Off

Circuit/System Description

The high side driver 1 is internal to the Hybrid/EV powertrain Control Module 1. With the ignition On, the high side driver 1 provides 12 V to the transmission control solenoid valve and line pressure control solenoid. If excessive current flow is detected in high side driver 1 circuit, the high side driver 1 will turn Off. When the circuit fault is corrected, the high side driver 1 will reset. The hybrid/EV powertrain control module 1 and both drive motor control modules are internal to the power inverter module, often referred to as the drive motor generator power inverter

module, and not serviced separately.

Conditions for Running the DTC

High side driver 1 is On.

Conditions for Setting the DTC

P0658

Hybrid/EV powertrain Control Module 1 has detected a short to ground on the high side driver 1 circuit during Hybrid/EV powertrain Control Module 1 initialization.

P0659

Hybrid/EV powertrain Control Module 1 has detected a short to voltage on the high side driver 1 circuit during Hybrid/EV powertrain Control Module 1 initialization.

Actions Taken When the DTC Sets

DTCs P0658, and P0659 are Type A DTCs.

P0658

- The Hybrid/EV powertrain control module commands maximum line pressure.
- The Hybrid/EV powertrain control module inhibits clutch 1, also call the variable low clutch.

Conditions for Clearing the DTC

DTCs P0658, and P0659 are Type A DTCs.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool High Side Driver 1 Command parameter displays On.
 - **If On is not displayed**

Refer to Circuit/System Testing.
 - **If On is displayed**
3. Verify the parameters listed below do not display Malfunction when commanding the high side driver 1, On and Off with a scan tool.
 - High Side Driver 1 Circuit Low Voltage Test Status
 - High Side Driver 1 Circuit Open Test Status
 - High Side Driver 1 Circuit High Voltage Test Status
 - **If Multifunction is displayed**

Refer to Circuit/System Testing.
 - **If Multifunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observe from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
6. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal

protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Remove the Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#).
3. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the Q8 Control Solenoid Valve.
4. Connect the 12 V battery.
5. Ignition ON, connect a test lamp between the high side driver circuit X1 terminal 1 and the ground.
6. Verify the test lamp turns ON.

• **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, replace the Automatic Transmission Wiring Harness - Control Solenoid Valve.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, replace the Automatic Transmission Wiring Harness - Control Solenoid Valve.
 - If less than 2 Ω , replace the T6 Power Inverter Module.

• **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the T6 Power Inverter Module.

• **If the test lamp turns ON and OFF**

7. Test or replace the Q8 Control Solenoid Valve.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for T6 Power Inverter Module replacement, often referred to as the

Drive Motor Generator Power Inverter Module, replacement, programming, and setup.

- Refer to [Control Solenoid Valve Replacement](#) for Q8 Control Solenoid Valve replacement.
- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#) for Automatic Transmission Wiring Harness - Control Solenoid Valve replacement.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P0711-P0713: TRANSMISSION FLUID TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Typical Scan Tool Data

Transmission Fluid Temperature

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running in Park, normal operating temperature Parameter Normal Range: -39 to +149Â°C (-38 to +300Â°F)			
TFT Signal	Greater than 149Â°C (300Â°F)	Less than -39Â°C (-38Â°F)	Less than -39Â°C (-38Â°F)*
Low Reference	-	Less than -39Â°C (-38Â°F)	Less than -39Â°C (-38Â°F)*
* Internal TFT sensor damage may result if shorted to B+			

Circuit/System Description

The primary source of heat in the transmission is the drive motor generators. The drive motor generators are cooled by the transmission fluid. Hot fluid exits the drive motor generators and flows to the transmission cooler supply line. The supply line connects to the transmission cooler, which is internal to the radiator. The transmission fluid cooler pipe assembly is equipped with an internal thermostat that opens at 80°C (176°F) for optimum transmission operation and fuel economy. The transmission cooler pipe thermostat is part of the transmission fluid cooler pipe assembly, located near the transmission and is not serviced separately. From the cooler, the fluid returns through the transmission fluid cooler pipe assembly and enters the lubrication circuits. After lubricating the internal components, the fluid returns to the oil pan. The transmission fluid temperature sensor is part of the control solenoid valve assembly and is not serviced separately.

Conditions for Running the DTC

- The ignition On is greater than 3 s.
- The system voltage is greater than 9 V.

P0711

- DTCs P0712, P0713, U179A, or U0293 are not active.
- Vehicle speed is detected for 5 s.
- Cold soak average and vehicle running transmission fluid temperature is between -40°C (-40°F) and 130°C (266°F).
- The difference between the transmission fluid temperature sensor and the cold soak average temperature is less than 15°C (27°F) at -40°C to -20°C (-40°F to -4°F) or less than 10°C (18°F) greater than -20°C (-40°F) ambient temperature.

Conditions for Setting the DTC

P0711

- The difference between the transmission fluid temperature sensor and the cold soak average temperature is greater than 15°C (27°F) at -40°C to -20°C (-40°F to -4°F) or greater than 10°C (18°F) greater than -20°C (-40°F) ambient temperature for greater than or equal to 300 s.

OR

- The transmission fluid temperature is stuck for greater than or equal to 300 s.

P0712

The Hybrid/EV Powertrain Control Module 1 detects a transmission fluid temperature sensor resistance of less than or equal to 68.6 Ω which corresponds to 149°C (300°F) for 2 s out of a 3 s window.

P0713

The Hybrid/EV Powertrain Control Module 1 detects a transmission fluid temperature sensor resistance of greater than or equal to 83,641 Ω which corresponds to -50°C (-58°F) for 2 s out of a 3 s window.

Actions Taken When the DTC Sets

- DTCs P0711, P0712 and P0713 are Type A DTCs.
- The Hybrid/EV powertrain control module switches to a calculated transmission fluid temperature.

Conditions for Clearing the DTC

DTCs P0711, P0712 and P0713 are Type A DTCs.

Diagnostic Aids

The Transmission Fluid Temperature parameter on the scan tool should rise steadily to a normal operating temperature, and then stabilize. Ask about the customer's driving habits, overloading, etc. Ensure the engine and transmission cooling system is functioning normally.

Special Tools

GE-24731 Tempil Stick

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

1. Vehicle ON, observe the scan tool Transmission Fluid Temperature and the ECT temperature parameter after a 9 hour cold soak. The readings should be between -50 to 149Â°C (-58Â°F to 300Â°F) and vary less than 15Â°C (27Â°F) at -40Â°C to -20Â°C (-40Â°F to -4Â°F) or less than 10Â°C (18Â°F) greater than -20Â°C (-40Â°F) from ambient temperature after an 9.5 hour cold soak. The transmission fluid temperature parameter should rise steadily then stabilize when the vehicle is driven for greater than 300 s.

- **If greater than the specified range, or stuck at a fixed temperature**

Refer to Circuit/System Testing.

- **If within the specified range**

Test for a transmission overheat condition. Refer to [Transmission Overheats](#) .

- **If no automatic transmission overheating condition exists**

2. Refer to Circuit System Testing.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Remove the Control Valve Body Cover. Refer to [Control Valve Body Cover Removal](#).
3. Vehicle Off and all vehicle systems Off. Disconnect the X1 harness connector at the Q8 Control Solenoid Valve. It may take up to 2 min. for all vehicle systems to power down.
4. Test for less than 10 Ω between the low reference circuit terminal 4 on the X1 harness connector and ground.
 - **If 10 Ω or greater**
 1. Vehicle Off, disconnect the Automatic Transmission Wiring Harness (Control Solenoid Valve) harness connector at the T6 Power Inverter Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, replace the Automatic Transmission Wiring Harness (Control Solenoid Valve).
 - If less than 2 Ω , replace the T6 Power Inverter Module.
 - **If less than 10 Ω**
5. Vehicle in Service Mode.
6. Test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground.
 - **If not between 4.8 - 5.2 V**
 1. Ignition Off, disconnect the Automatic Transmission Wiring Harness (Control Solenoid Valve) harness connector at the T6 Power Inverter Module.

2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, replace the Automatic Transmission Wiring Harness (Control Solenoid Valve).
 - If infinite resistance
3. Test for less than 1 Ω in the signal circuit end to end.
 - If 1 Ω or greater, replace the Automatic Transmission Wiring Harness (Control Solenoid Valve).
 - If less than 1 Ω , replace the T6 Power Inverter Module.
 - **If between 4.8 - 5.2 V**
7. Replace the Q8 Control Solenoid Valve.

Component Testing

1. Perform each step listed below:
 - Perform the [Fluid Leak Diagnosis](#).
 - Perform the [Transmission Fluid Level and Condition Check](#) procedure.
 - Perform the [Line Pressure Check](#) procedure.
 - Perform the [Automatic Transmission Fluid Pump Pressure High or Low](#) procedure.
 - With a hand held infra-red thermometer, or **GE-24731** tempil stick test for the transmission cooler supply line thermostat for opening at 80 $\hat{\text{A}}$ °C (176 $\hat{\text{A}}$ °F). The transmission cooler supply line temperature should be higher on the transmission side of the thermostat than the cooler side until 80 $\hat{\text{A}}$ °C (176 $\hat{\text{A}}$ °F) is reached.
 - **If the thermostat tests stuck open or closed**

Replace the transmission cooler supply pipe assembly.
 - **If thermostat tests OK**
2. Perform the [Control Solenoid Valve Performance Test](#).
 - **If a concern is found**

Replace the Q8 Control Solenoid Valve.
 - **If a concern is not found**
3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#)
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup.
- Refer to [Control Solenoid Valve Replacement](#) for Q8 Control Solenoid Valve replacement.
- Refer to [Automatic Transmission Wiring Harness Replacement](#)
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P0721: OUTPUT SPEED SENSOR PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0721

Output Speed Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
OSS Supply Voltage	P077C, P215C	P077D, P215C	P215C	P0721, P077B, P215C
Low Reference	P215C	P215C	P215C	P0721, P077B, P215C

Typical Scan Tool Data

Output Shaft Direction

Circuit	Normal Range	Open/High Resistance	Short to Voltage	Short to Ground
Operating Conditions: Vehicle moving, normal operating temperature				
Transmission OSS	Forward/Reverse	Invalid/Unknown	Invalid/Unknown	Invalid/Unknown
Output Shaft Speed Sensor	Greater than 0 RPM	0 RPM	0 RPM	0 RPM

Circuit/System Description

The A/Trans Output Speed Sensor Assembly has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The output speed sensor is internal to the transmission and mounts to the A/Trans case assembly and is connected to the hybrid/EV powertrain control module 1 through the transmission internal harness. The A/Trans Output Speed Sensor Assembly faces the park gear machined teeth surface. The sensor receives 5 V on the OSS supply voltage circuit from the hybrid/EV powertrain control module 1. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft. The two sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the hybrid/EV powertrain control module 1 for speed and direction and is transmitted through the serial data circuits to the engine control module (ECM). The ECM, hybrid/EV powertrain control module 1, compare the output speed sensor signal with the antilock brake system (ABS) wheel speed sensor signal. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced.

separately.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 detects an invalid Automatic Transmission Output Shaft Speed Sensor direction for 2.5 s within a 3 s window.

Action Taken When the DTC Sets

The hybrid/EV powertrain control module 1 calculates vehicle speed based on the drive motor 2 speed.

Conditions for Clearing the DTC

DTC P0721 is a Type A DTC.

OSS Signal	P077C, P215B	P0721, P215B, P077D	P0721, P215B, P077D	P077B, P0721, P215C

Typical Scan Tool Data

Output Shaft Direction

Circuit	Normal Range	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature			
Transmission OSS	Forward/Reverse	Out of Range	Out of Range
OSS Supply Voltage	OK	Out of Range	Out of Range

Circuit/System Description

The transmission output shaft speed sensor has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The transmission output shaft speed sensor mounts to the A/Trans case assembly and is connected to the hybrid/EV powertrain control module 1 assembly through a wire harness and connector. The sensor faces the drive sprocket machined teeth surface. The sensor receives 5 V on the OSS supply voltage circuit from the hybrid/EV powertrain control module 1. As the drive sprocket rotates, the sensor produces a signal frequency based on the machined surface of the drive sprocket.

The two sensor elements in the transmission output shaft speed sensor are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the hybrid/EV powertrain control module 1 for speed and direction and is transmitted through the GMLAN circuits to the ECM. The ECM and hybrid/EV powertrain control module 1, compare the OSS signal with hybrid motor speed/direction and the ABS wheel speed sensor signal.

Conditions for Running the DTC

P077B

- DTC P0721, P077C, P077D, or P215C is not set.
- The drive motor estimated output speed is greater than 50 RPM.

P077C

- DTC P077D is not set.
- System voltage is at least 9 V and no more than 32 V.

P077D

- DTC P077B is not set.
- System voltage is at least 9 V and no more than 32 V.

Conditions for Setting the DTC

P077B

The hybrid/EV powertrain control module 1 detects an incorrect OSS direction.

P077C

The hybrid/EV powertrain control module 1 detects the output speed sensor signal voltage is less than 0.36 V for 0.25 s.

P077D

The hybrid/EV powertrain control module 1 detects the output speed sensor signal voltage is greater than 4.25 V for 0.25 s.

Action Taken When the DTC Sets

The hybrid/EV powertrain control module 1 uses drive motor 2 speed to calculate vehicle speed.

Conditions for Clearing the DTC

P077B, P077C, and P077D are Type A DTCs.

Diagnostic Aids

Inspect the output speed sensor, harness, connector and control solenoid valve assembly pins for metallic debris and output shaft machined face for damage or misalignment. Proper torque of the output speed sensor mounting bolt is critical to proper output speed sensor operation. Use a terminal test kit for any test that requires probing the control solenoid valve assembly harness connector or a component harness connector.

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

[Control Module References](#) for scan tool information.

Special Tools

EL 38522 Variable Signal Generator

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

1. Verify that DTC P0721, P0970, P0971, P0973, P2720, P2721, P2729, or P2730 are not set.
 - If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Operate the vehicle at 16 - 32 km/h (10 - 20 mph) while observing the Transmission Data OSS Direction parameter on the scan tool. The OSS Direction parameter should match vehicle direction.
 - If the OSS parameter corresponds with the vehicle direction and the DTC is set, replace the T6 power inverter module.

Circuit/System Testing

1. Vehicle ON.
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
3. Verify DTC P077B, P077C, or P077D is not set.
 - **If DTC is set**

Perform the [Output Shaft Speed Input Test](#).
 - **If the DTC is not set**
4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for Drive Motor Generator Power Inverter Module, also called the T6 power inverter module replacement, programming, and setup
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P079A: TRANSMISSION CLUTCH 1 SLIP DETECTED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P079A

Transmission Clutch 1 Slip Detected

Typical Scan Tool Data

Variable Low Clutch Reference

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0 - 161 km/h (0 - 100 mph) Parameter Normal Range: 0 - 6,000 RPM			
Clutch 1 Slip Speed	0 RPM	0 - 6,000 RPM	0 - 6,000 RPM
Clutch 1 Status	Applied	Released	Applied

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors the Clutch 1 Slip Speed for each Hybrid Transmission Mode Commanded state. The hybrid/EV powertrain control module 1 monitors clutch slip when the variable low clutch is applied. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Clutch 1 is applied.
- No P1B0D, P1B0E, P1E4A or P1E4B DTCs.
- The commanded line pressure is at least 190 kPa (28 psi) for 1 s.
- The variable low clutch torque estimated is greater than 74 N.m (55 lb ft) for 1 s.
- Wheel slip speed is 0.
- Shutdown is not commanded.

Conditions for Setting the DTC

- The hybrid/EV powertrain control module 1 detects clutch 1 slip speed greater than 190 RPM for 1 s, 3 times within the same key cycle.
- Clutch 1 energy is greater than 8 joules 3 times within the same key cycle, the fault will set instantly.

Action Taken When the DTC Sets

- P079A is a Type A DTC.
- The hybrid/EV powertrain control module 1 commands the internal combustion engine On.
- The hybrid/EV powertrain control module 1 inhibits mode 1 and gear 1.

Conditions for Clearing the DTC

P079A is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC P0721, P077B-P077D or P215C is not set.
 - **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - **If the DTC is not set**
3. Verify correct fluid level and condition by performing the [Transmission Fluid Level and Condition Check](#).
4. Verify correct oil pressure by performing the [Line Pressure Check](#).
5. Operate the vehicle within the Conditions for Running the DTC. The Clutch 1 Slip Speed parameter reading should be less than 190 RPM when the Clutch 1 Status parameter reading is Applied.
 - **If clutch slip speed is greater than 190 RPM**

Refer to Component Testing.
 - **If clutch slip speed is less than 190 RPM**
6. All OK.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#)
2. Verify control solenoid valve assembly condition by performing the [Control Solenoid Valve Inspection](#).
3. Verify control solenoid valve assembly function by performing the [Control Solenoid Valve Performance Test](#).

- **If a concern is found**

Replace the Q8 Control Solenoid Valve.

- **If no concern is found**

4. Inspect the a/trans fluid level control valve for stuck closed or damaged condition.

- **If you found a concern with the a/trans fluid level control valve**

Replace the a/trans fluid level control valve.

- **If no concern is found**

5. Inspect the valve body components and hydraulic circuits listed below for a leak or a stuck valve. Refer to [Control Valve Body Diagnostic Inspection](#):

- Control valve body spacer (w/gasket) plate assembly
- Variable low clutch valve and variable low clutch accumulator.
- **If you found a concern in the valve body**

Repair or replace the valve or valve body.

- **If no concern is found**

6. Inspect the variable low clutch assembly snap ring, piston, clutch discs, and housing for a slipping or damaged condition.

- **If you found a variable low clutch assembly concern**

Repair or replace the variable low clutch assembly as necessary.

- **If no concern is found**

7. Replace the T6 Power Inverter Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Valve Body Replacement](#) for control valve body replacement.
- Refer to [Control Solenoid Valve Replacement](#) for Q8 Control Solenoid Valve replacement.
- Refer to [Variable Low Clutch Plate Removal](#), and [Variable Low Clutch Plate Installation](#) for variable low clutch replacement.
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module replacement, programming, and setup.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P079B: TRANSMISSION CLUTCH 2 SLIP DETECTED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P079B

Transmission Clutch 2 Slip Detected

Typical Scan Tool Data

Variable High Clutch Reference

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0 - 80 km/h (0 - 50 mph) Parameter Normal Range: 0 - 6,000 RPM			
Clutch 2 Slip Speed	0 RPM	0 - 6,000 RPM	0 - 6,000 RPM
Clutch 2 Status	Applied	Released	Applied

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors Clutch 2 Slip Speed for each Hybrid Transmission Mode Commanded state. The hybrid/EV powertrain control module 1 monitors clutch slip when the variable high clutch is commanded ON. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Clutch 2 is applied.
- No P1B0D, P1B0E, P1E4A or P1E4B DTCs.
- The commanded line pressure is at least 190 kPa (28 psi) for 1 s.
- The variable high clutch torque estimated is greater than 15 N.m (11 lb ft) for 1 s.
- Wheel slip speed is 0.
- Shutdown is not commanded.

Conditions for Setting the DTC

- The hybrid/EV powertrain control module 1 detects clutch 2 slip speed greater than 100 RPM for 2.5 s within a 3 s window, 3 times within the same key cycle.
- Clutch 1 energy is greater than 5.8 joules 3 times within the same key cycle, the fault will set instantly.

Action Taken When the DTC Sets

- DTC P079B is a Type A DTC.
- The hybrid/EV powertrain control module 1 inhibits mode 2 and gear 1.

Conditions for Clearing the DTC

P079B is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P079C

Transmission Clutch 3 Slip Detected

Typical Scan Tool Data

Input Brake Clutch Reference

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0 - 161 km/h (0 - 100 mph) Parameter Normal Range: 0 - 6,000 RPM			
Clutch 3 Slip Speed	0 RPM	0 - 6,300 RPM	0 - 6,300 RPM
Clutch 3 Status	Applied	Released	Applied

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors the Clutch Slip 3 Speed for each Hybrid Transmission Mode Commanded state. Clutch 3 in the vehicle software is tied to the input brake clutch in the transmission. This is a one way mechanical clutch. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Line pressure command is greater than 190 kPa (27.6 psi) for 1 s.
- No P1B0D, P1B0E, P1E4A, or P1E4B motor speed DTCs are set.
- Clutch 3 command is Locked.
- Wheel slip speed is 0.
- Shutdown is not commanded.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 detects the clutch 3 Slip Speed is greater than 100 RPM for 1 s.

Action Taken When the DTC Sets

- P079C is a Type A DTC.
- The hybrid/EV powertrain control module 1 commands the internal combustion engine On.

Conditions for Clearing the DTC

P079C is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Component Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and

personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#) .
2. Inspect the flexplate for a broken condition.
3. Inspect the input brake clutch for a broken condition.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Transmission Replacement](#) for Transmission removal
- Refer to [Automatic Transmission Flex Plate Removal](#)
- Refer to [Automatic Transmission Torque Dampener and Differential Housing Disassemble](#) for Input Brake Clutch removal procedure
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P07A3: TRANSMISSION CLUTCH 1 STUCK ON

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P07A3

Transmission Clutch 1 Stuck On

Typical Scan Tool Data

Variable Low Clutch Reference

Parameter	Commanded ON	Commanded OFF	Stuck/Welded When
-----------	--------------	---------------	-------------------

			Commanded OFF
Operating Conditions: Vehicle speed 0 - 50 MPH (80 km/h)			
Parameter Normal Range: 0 - 6,000 RPM			
Clutch 1 Slip Speed	0 RPM	0 - 9,500 RPM	0 RPM
Clutch 1 Status	Applied	Released	Released

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors the variable low clutch slip speed for each Hybrid/EV Transmission Mode Command state. Low clutch slip speed when the clutch is commanded Off indicates a stuck or welded clutch condition. If the hybrid/EV powertrain control module 1 detects a stuck clutch condition, the hybrid/EV powertrain control module 1 will cycle the clutch 3 times within 30 seconds. The customer may feel 3 bumps before the DTC sets. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Variable low clutch (Clutch 1) is commanded OFF.
- No P179A, P1B0D, P1B0E, P1E4A, or P1E4B motor speed DTCs are set.
- Shutdown is not commanded.

Conditions for Setting the DTC

Clutch slip is less than 30 RPM 3 times within 1 s when clutch slip is expected.

Action Taken When the DTC Sets

- P07A3 is a Type A DTC.
- The hybrid/EV powertrain control module 1 commands clutch 1 and clutch 2 Off.

Conditions for Clearing the DTC

P07A3 is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any transmission output speed sensor DTCs set, diagnose those first.

[Circuit/System Verification](#)

1. Verify that P0721, P077B-P077D or P215C is not set.
 - If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#).
2. Perform the [Transmission Fluid Level and Condition Check](#) to verify correct fluid level and condition.
 - If the transmission fluid is low or discolored, refer to [Transmission Fluid Drain and Fill](#).
3. Operate the vehicle within the Conditions for Running the DTC while monitoring the Clutch 1 Slip Speed parameter. The Clutch 1 Slip Speed parameter should display greater than 30 RPM when the Clutch 1 Status parameter displays Released.
 - If the DTC P07A3 resets, go to Component Testing.

[Component Testing](#)

1. Verify correct oil pressure by performing the [Line Pressure Check](#).
2. Perform the [Control Solenoid Valve Performance Test](#).
 - If a concern is found, replace the Q8 control solenoid valve.
3. Inspect the valve body assembly for sticking or damaged valves. Refer [Control Valve Body Diagnostic Inspection](#).
 - If you found a stuck or damaged valve, repair or replace the valve or valve body.
4. Inspect the variable low clutch for a stuck On or damaged condition.
 - If you found a variable low clutch concern, repair or replace the variable low clutch assembly as necessary.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Refer to [Variable Low Clutch Plate Removal](#), and [Variable Low Clutch Plate Installation](#) for variable clutch repair or replacement.
- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#) for Q8 control solenoid valve or control valve body replacement.
- Refer to [Transmission Replacement](#) for transmission removal.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P07A5: TRANSMISSION CLUTCH 2 STUCK ON

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P07A5

Transmission Clutch 2 Stuck On

Typical Scan Tool Data

Variable High Clutch Reference

Parameter	Commanded ON	Commanded OFF	Stuck/Welded When Commanded OFF
Operating Conditions: Vehicle speed 0 - 50 MPH (80 km/h) Parameter Normal Range: 0 - 6,000 RPM			
Clutch 2 Slip Speed	0 RPM	0 - 6,000 RPM	0 RPM
Clutch 2 Status	Applied	Released	Released

Circuit/System Description

The hybrid/EV powertrain control module monitors the Clutch Slip parameters for each Hybrid/EV Transmission Mode Command state. Low clutch slip speed when the clutch is commanded Off indicates a stuck or welded clutch condition. If the hybrid/EV powertrain control module 1 detects a stuck clutch condition, the hybrid/EV powertrain control module 1 will cycle the clutch 3 times within 30 seconds. The customer may feel 3 bumps before the DTC sets. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Variable high clutch (Clutch 2) is commanded Off.
- No P179B, P1B0D, P1B0E, P1E4A, or P1E4B motor speed DTCs are set.
- Shutdown is not commanded.

Conditions for Setting the DTC

Clutch slip is less than 30 RPM 3 times within 1 s when clutch slip is expected.

Action Taken When the DTC Sets

- P07A5 is a Type A DTC.
- The hybrid/EV powertrain control module 1 inhibits mode 1.
- The hybrid/EV powertrain control module 1 commands clutch 1 and clutch 2 Off.
- The hybrid/EV powertrain control module 1 commands the internal combustion engine On.

Conditions for Clearing the DTC

P07A5 is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Circuit/System Verification

1. Verify that P0721, P077B-P077D or P215C is not set.
 - If any of the DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle .
2. Perform the Transmission Fluid Level and Condition Check to verify correct fluid level and condition.
 - If the transmission fluid is low or discolored, refer to Transmission Fluid Drain and Fill.
3. Operate the vehicle within the Conditions for Running the DTC while observing the Clutch 2 Slip Speed parameter. The Clutch 2 Slip Speed parameter should display greater than 30 RPM when the Clutch 2 Status parameter displays Released.
 - If the DTC P07A5 is set, go to Component Testing.

Component Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Verify correct oil pressure by performing the [Line Pressure Check](#).
 - If you found a concern, repair the concern.
3. Perform the [Control Solenoid Valve Performance Test](#).
 - If a concern is found, replace the Q8 control solenoid valve assembly.
4. Inspect the valve body assembly for sticking or damaged valves. Refer [Control Valve Body Diagnostic Inspection](#).
 - If you found a concern, repair or replace the valve or valve body.
5. Inspect the variable high clutch for a stuck On or damaged condition.
 - If you found a variable high clutch concern, repair or replace the variable high clutch assembly as necessary.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Refer to [Variable High Clutch Removal](#), and [Variable High Clutch Installation](#) for variable high clutch replacement or overhaul.
- Refer to [Control Valve Body Replacement](#) for control valve body replacement.
- Perform the valve body inspection procedure, refer to [Control Solenoid Valve Inspection](#). If the inspection procedure indicates to replace the valve body, refer to [Control Valve Body Replacement](#).
- Refer to [Transmission Replacement](#) for transmission removal.
- Refer to [Control Solenoid Valve Replacement](#) for Q8 Control Solenoid Valve replacement.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P07A7: TRANSMISSION CLUTCH 3 STUCK ON

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P07A7

Transmission Clutch 3 Stuck On

Typical Scan Tool Data

Input Brake Clutch Reference

Parameter	Commanded ON	Commanded OFF	Stuck when Commanded OFF
Operating Conditions: Vehicle speed 0 - 161 km/h (0 - 100 mph) Parameter Normal Range: 0 - 6,000 RPM			
Clutch 3 Slip Speed	0 RPM	0 - 6,300 RPM	0 - 6,300 RPM
Clutch 3 Status	Applied	Released	Applied

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors the Clutch Slip 3 Speed for each Hybrid Transmission Mode Commanded state. Clutch 3 in the vehicle software is tied to the input brake clutch in the transmission. This is a one way mechanical clutch. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

Clutch 3 command is Off.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 detects the clutch 3 Slip Speed is greater than 0 RPM for 1 s when commanded Off.

Action Taken When the DTC Sets

- P07A7 is a Type A DTC.
- The hybrid/EV powertrain control module 1 inhibits gear 1.
- The hybrid/EV powertrain control module 1 commands the internal combustion engine Off.

Conditions for Clearing the DTC

P07A7 is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in

duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Reference Information

Schematic Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that the internal combustion engine (ICE) starts and stays running.

- **If the ICE does not start**

Refer to Engine Will Not Crank - Crankshaft Will Not Rotate

- **If the ICE starts and stays running**

2. All OK.

Component Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Inspect the input brake clutch for a broken or seized condition. The input break clutch should rotate freely in one direction and lock in the other direction.
3. If the input brake clutch tests OK, replace the T6 Power Inverter Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Seized Engine or Transmission Separation](#)
- Refer to [Transmission Replacement](#) for Transmission removal
- Refer to [Automatic Transmission Torque Dampener and Differential Housing Disassemble](#) for Input Brake Clutch removal procedure
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Refer to [Control Module References](#) for T6 Power Inverter Module, replacement, programming, and setup.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P0960, P0962, OR P0963: TRANSMISSION CONTROL SOLENOID VALVE 1 CONTROL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0960

Transmission Control Solenoid Valve 1 Control Circuit Open

DTC P0962

Transmission Control Solenoid Valve 1 Control Circuit Low Voltage

DTC P0963

Transmission Control Solenoid Valve 1 Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Line Pressure Control Solenoid Low Side Driver	P0962	P0963	P0963	P0960

Circuit/System Description

The line pressure control solenoid regulates the transmission fluid line pressure. The hybrid/EV powertrain control module 1 varies the current to the normally high line pressure control solenoid valve from 0.1 amp for maximum line pressure, to 1.1 amps for minimum line pressure. This is accomplished by varying the current in order to obtain the desired line pressure in kPa (psi). The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- The propulsion system is active.
- The system voltage is 11 - 18 volts.

Conditions for Setting the DTC

P0960

The transmission control module detects an internal electrical performance malfunction of the line pressure control solenoid control circuit for 5 s.

P0962

The transmission control module detects an internal low voltage electrical malfunction of the line pressure control solenoid control circuit for 400 milliseconds.

P0963

The transmission control module detects an internal high voltage electrical malfunction of the line pressure control solenoid control circuit for 400 milliseconds.

Action Taken When the DTC Sets

DTCs P0960, P0962 and P0963 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0960, P0962 and P0963 are Type A DTCs.

Control Module References for scan tool information.

Circuit/System Verification

1. Vehicle ON, verify the transmission fluid temperature is between 50 - 80°C (122 - 176°F).
2. Drive the vehicle, observe the scan tool Line Pressure Control Solenoid Valve Test Status parameters. The reading should display OK.
 - **If the reading is not within the specified value**

Refer to Circuit/System Testing.
 - **If the reading is within specification**
3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.

- Visually and functionally inspect the gloves before use.
- Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Remove the Control Valve Body Cover, refer to [Control Valve Body Cover Replacement](#).
3. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the Q23 Line Pressure Control Solenoid Valve.
4. Connect the 12 V battery.
5. Ignition ON, connect a test lamp between the Q23 Line Pressure Control Solenoid Valve circuit terminal A and the ground circuit terminal B.
6. Verify the test lamp turns ON and OFF when commanding the Line Pressure Control Solenoid Valve Increase and Decrease with a scan tool.

• **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module.
2. Test for infinite resistance between the control circuit and switched ground circuit to ground.
 - If less than infinite resistance, replace the Automatic Transmission Wiring Harness - Shift Shaft Position Switch.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit and switched ground circuits end to end.
 - If 2 Ω or greater, replace the Automatic Transmission Wiring Harness - Shift Shaft Position Switch.
 - If less than 2 Ω , replace the T6 Power Inverter Module.

• **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, replace the Automatic Transmission Wiring Harness - Shift Shaft Position Switch.
 - If less than 1 V, replace the T6 Power Inverter Module.

• **If the test lamp turns ON and OFF**

7. Replace the Q23 Line Pressure Control Solenoid Valve.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for T6 Power Inverter Module replacement.
- Refer to [Line Pressure Control Solenoid Valve Replacement](#) for Q23 Line Pressure Control Solenoid Valve replacement.
- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#) to replace the Automatic Transmission Wiring Harness - Shift Shaft Position Switch.

- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Clutch Pressure Control Solenoid 2/3/4/5 Control	P0966, P0970, P2720, P2729	P0964, P0968, P2718, P2727	P0967, P0971, P2721, P2730

Circuit/System Description

The hybrid/EV powertrain control module 1 supplies 12 volts to the clutch pressure control solenoid valve. The hybrid/EV powertrain control module 1 controls the pressure control solenoids through the clutch pressure control solenoid valve control circuits. The normally closed pressure control solenoid valve flows fluid to the appropriate transmission hydraulic circuit when commanded ON. The clutch pressure control solenoids are part of the control solenoid valve and are not serviced separately.

Conditions for Running the DTC

- Propulsion system is active.
- The system voltage is 9 - 16 V.

Conditions for Setting the DTC

P0964, P0968, P2718, P2727

The hybrid/EV powertrain control module 1 detects an open solenoid control circuit for 1 s.

P0966, P0970, P2720, P2729

The hybrid/EV powertrain control module 1 detects a low voltage solenoid control circuit for 1 s.

P0967, P0971, P2721, P2730

The hybrid/EV powertrain control module 1 detects a high voltage solenoid control circuit for 1 s.

Actions Taken When the DTC Sets

DTCs P0964, P0966, P0967, P0968, P0970, P0971, P2718, P2720, P2721, P2727, P2729, and P2730 are Type A DTCs.

P0964, P0967

- The hybrid/EV powertrain control module 1 inhibits mode 1.
- The hybrid/EV powertrain control module 1 inhibits gear 1.
- The hybrid/EV powertrain control module 1 inhibits commands the internal combustion engine On.

P0966

- The hybrid/EV powertrain control module 1 inhibits mode 2.
- The hybrid/EV powertrain control module 1 commands clutch 1 and clutch 2 Off.

P2718

The hybrid/EV powertrain control module 1 inhibits mode 2 and gear 1.

P2720

- The hybrid/EV powertrain control module 1 inhibits mode 1.
- The hybrid/EV powertrain control module 1 inhibits commands the internal combustion engine On.

P2721

- The hybrid/EV powertrain control module 1 inhibits mode 2.
- The hybrid/EV powertrain control module 1 inhibits gear 1.

Conditions for Clearing the DTC

DTCs P0964, P0966, P0967, P0968, P0970, P0971, P2718, P2720, P2721, P2727, P2729, and P2730 are Type A DTCs.

Control Module References for scan tool information.

Circuit/System Verification

1. Vehicle ON, verify the transmission fluid temperature is between 50 - 80°C (122 - 176°F).
2. Drive the vehicle in order to obtain single motor mode, observe the scan tool Pressure Control Solenoid Valve Performance Test Status parameters. The readings should display OK.

- **If the reading is not within the specified range**

Refer to Circuit/System Testing.

- **If the reading is within specified range**

3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Remove the Control Valve Body Cover, refer to [Control Valve Body Cover Replacement](#).
3. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the Q8 Control Solenoid Valve Assembly.
4. Connect the 12 V battery.
5. Ignition ON, connect a test lamp between the control circuit terminal and the ground circuit terminals listed below:
 - Solenoid valve 2, high side driver circuit terminal 1 to control circuit terminal 2
 - Solenoid valve 3, high side driver circuit terminal 7 to control circuit terminal 8
 - Solenoid valve 4, high side driver circuit terminal 7 to control circuit terminal 6
 - Solenoid valve 5, high side driver circuit terminal 7 to control circuit terminal 5
6. Verify the test lamp turns ON and OFF when commanding the Pressure Control Solenoid Valve On and Off with a scan tool for each corresponding solenoid.
 - **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, replace the Automatic Transmission Wiring Harness - Control Solenoid Valve.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, replace the Automatic Transmission Wiring Harness - Control Solenoid Valve.
 - If less than 2 Ω , replace the T6 Power Inverter Module.
- **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the T6 Power Inverter Module.
- **If the test lamp turns ON and OFF**
7. Replace the Q8 Control Solenoid Valve.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for T6 Power Inverter Module replacement.
- Refer to [Control Solenoid Valve Replacement](#) for Control Solenoid Valve replacement.
- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#) for Automatic Transmission Wiring Harness - Control Solenoid Valve replacement.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P152A OR P152D: REGENERATIVE BRAKING CONTROL SWITCH 1 CIRCUIT/REGENERATIVE BRAKING CONTROL SWITCH 1 AND 2 CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P152A

Regenerative Braking Control Switch 1 Circuit

DTC P152D

Regenerative Braking Control Switch 1 and 2 Circuit

Diagnostic Fault Information

Regenerative Braking On Demand

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Normal Range = Inactive/Active				
Tap Up/Tap Down Switch Signal 2 Circuit	P152D	Regenerative Braking On Demand Malfunction	Regenerative Braking On Demand Malfunction	P152A, P152C

Circuit/System Description

Regenerative Braking On Demand enables drivers to actively re-capture energy when slowing down, such as when approaching slower traffic or setting up for a tight turn. To engage Regenerative Braking On Demand, the driver releases the accelerator pedal and pulls back on the left steering-wheel paddle to begin regenerating electricity. When engaged, Regenerative Braking On Demand provides vehicle deceleration that is more than what a typical vehicle experiences while coasting or when the transmission shifter is in the L position, providing control and dynamic performance characteristics similar to downshifting in a manual-transmission vehicle. The feature does not bring the vehicle to a complete stop. Releasing the paddle cancels the Regeneration on Demand request, allowing the vehicle to coast normally. The driver can engage and disengage Regeneration on Demand as desired and as traffic conditions allow. When Regenerative Braking On Demand is requested, a signal is sent to the Body Control Module and then to the hybrid/EV powertrain control module 1 via serial data. The Regenerative Braking On Demand parameter is displayed as Inactive and Active on the scan tool. The Regenerative Braking On Demand parameter states are listed below:

- Inactive - when the S2L automatic transmission manual shift switch-left is not switch is pressed
- Active - when the S2L automatic transmission manual shift switch-left is pressed

Conditions for Running the DTC

Propulsion system is active.

Conditions for Setting the DTC

P152A

The hybrid/EV powertrain control module 1 detects the Regenerative Braking On Demand is active for greater than 600 s.

P152D

The hybrid/EV powertrain control module 1 detects an invalid voltage regenerative braking on demand switch - left circuit for 60 s.

Action Taken When the DTC Sets

- DTC P152A and P152D are Type C DTCs.
- The hybrid/EV powertrain control module 1 disables regenerative braking on demand.

Conditions for Clearing the DTC

DTC P152A and P152D are Type C DTCs.

Diagnostic Aids

DTC P152A can be customer induced by holding regenerative braking control switch in the regeneration on demand position while driving for greater than 600 s. Verify the customer is not pressing the switch for greater than 600 s.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle ON, verify with a scan tool the following hybrid/EV powertrain control module 1 parameter displays the correct values the S2L automatic transmission manual shift switch-left state:
 - Regenerative Braking On Demand displays Inactive when not pressed.
 - Regenerative Braking On Demand displays Active when pressed.
 - **If the hybrid/EV powertrain control module 1 parameter is incorrect**

Refer to Circuit/System Testing.
 - **If the hybrid/EV powertrain control module 1 Regenerative Braking On Demand parameter is correct**
2. After performing the above step, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S2L automatic transmission

manual shift switch-left. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminal X1 3 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Vehicle ON.

4. Verify the scan tool Regenerative Braking On Demand parameter is Inactive.

- **If not Inactive**

1. Vehicle OFF, disconnect the harness connector at the K9 BCM X3 connector.

2. Test for infinite resistance between the signal circuit terminal X3 21 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 BCM.

- **If Active**

5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.

6. Verify the scan tool Regenerative Braking On Demand parameter is Active.

- **If not Inactive**

1. Vehicle OFF, remove the jumper wire, disconnect the X3 harness connector at the K9 BCM, vehicle ON.

2. Test for less than 1 V between the signal circuit terminal 21 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 BCM.

- **If Active**

7. Test or replace the S2L automatic transmission manual shift switch-left.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Refer to [Steering Wheel Replacement](#) for S2L automatic transmission manual shift switch-left replacement.
- Refer to [Control Module References](#) for K9 BCM replacement, programming, and setup.

DTC P152C: REGENERATIVE BRAKING CONTROL SWITCH SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P152C

Regenerative Braking Control Switch Signal Message Counter Incorrect

Circuit/System Description

Hybrid Low Mode enables drivers to actively re-capture energy when slowing down, such as when approaching slower traffic or setting up for a tight turn. To engage hybrid low mode the shift lever is placed in low (L), the driver shift request, also known as the tap shift function is activated. The driver shift request allows the vehicle operator to switch from L2 to L1 pressing the minus (-) button and back to L2 by pressing the plus (+) button. The body control module (BCM) supplies a signal circuit to the automatic transmission manual shift switch. The automatic transmission manual shift switch has switches connected to a resistor array. When the lever is in the L position, a voltage drop occurs across the resistor network. When the plus or minus button is pressed, a corresponding voltage drop occurs across the resistor network. This voltage drop is monitored by the BCM. The BCM will send the request to the hybrid/EV powertrain control module 1 to perform the transition from L2 to L1 or if already in L1 then back to L2. When the shifter is moved the L position, the instrument cluster will display L2, the hybrid/EV powertrain control module 1 will command a higher level of regenerative braking than what is commanded in the D position. When the minus (-) button is pressed, the L1 mode is commanded by the hybrid/EV powertrain control module 1. When the plus (+) button is pressed when in L1 mode the system will transition back to L2.

Conditions for Running the DTC

The propulsion system is active.

Conditions for Setting the DTC

The hybrid/EV powertrain control module has detected a drive mode signal rolling count error for 0.8 seconds.

Action Taken When the DTC Sets

DTC P152C is a Type C DTC.

Conditions for Clearing the DTC

DTC P152C is a Type C DTC.

Diagnostic Aids

When attempting to set hybrid/EV powertrain control module serial data DTCs, run the vehicle in propulsion system active mode for at least 1 minute, and then shut the vehicle off for 30 seconds. Following this procedure will allow for a complete hybrid/EV powertrain control module shutdown.

[Circuit/System Verification](#)

1. Run the vehicle in propulsion system active mode for 1 minute, then vehicle OFF for 30 seconds.
2. Verify DTC P152C is not set.
 - **If the DTC is set**
 1. Program the T6 Power Inverter Module.
 2. Verify the DTC does not set.
 - If the DTC is set, replace the T6 Power Inverter Module.
 - If the DTC does not set
 3. All OK.
 - **If the DTC is not set**
3. All OK.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for T6 Power Inverter Module replacement, programming and setup.
- Refer to [Solenoid Valve Characterization Reprogramming](#) if the T6 Power Inverter Module is programmed or replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P16F7: CONTROL MODULE PRESSURE CONTROL SOLENOID COMMAND INCORRECT

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P16F7

Control Module Pressure Control Solenoid Command Incorrect

[Circuit/System Description](#)

This is an internal fault detection of the hybrid/EV powertrain control module 1 or drive motor control modules. The hybrid/EV powertrain control module 1 and both drive motor control modules are internal to the power inverter module, often referred to as the drive motor generator power inverter module, and not serviced separately. This fault is handled inside the power inverter module, and no external circuits are involved.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P16F7 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P16F7 is a Type A DTC.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P0562 is not set.

- **If the DTC is set**

Refer to [DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0561-P0563, P1A0C, P1A0D, or P1EFC](#) .

- **If the DTC is not set**

3. Verify DTC P16F7 is not set.

- **If the DTC is set**

1. Program the T6 Power Inverter Module.
2. Verify the DTC does not set.

- If the DTC sets, replace the T6 Power Inverter Module.
- If the DTC does not set.

3. All OK

- **If the DTC is not set**

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P179C: TRANSMISSION CLUTCH 1 MINOR SLIP DETECTED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P179C

Transmission Clutch 1 Minor Slip Detected

Typical Scan Tool Data

Variable Low Clutch Reference

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0 - 161 km/h (0 - 100 mph)			
Parameter Normal Range: 0 - 6,000 RPM			
Clutch 1 Slip Speed	0 RPM	0 - 6,000 RPM	0 - 6,000 RPM
Clutch 1 Status	Applied	Released	Applied

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors the Clutch 1 Slip Speed for each Hybrid Transmission Mode Commanded state. The hybrid/EV powertrain control module 1 monitors clutch slip when the variable Low clutch is applied.

Conditions for Running the DTC

- The clutch pressure control solenoid valve 3 commanded pressure is at least 1800 kPa (261 psi) for 1 second.
- The variable clutch torque estimated is greater than 200 N.m (148 lb ft).
- The variable clutch fill detected.

- The commanded mode is:
 - Reverse
 - Dual Electric Motors
 - Dual Electric Motors and ICE

Conditions for Setting the DTC

- The transmission control module detects Hybrid low clutch slip greater than 200 RPM for 63 seconds, 3 times within the same key cycle, repeated 30 seconds apart.
- Motor 1 or 2 are approaching overspeed limits due to clutch slip, the fault will set instantly.

Action Taken When the DTC Sets

P179C is a Type B DTC.

Conditions for Clearing the DTC

P179C is a Type B DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC P0721, P0796, P0966, P0967, P0969, P0970, P0971, P0973, P0974, P0976, P0977, P215C, P2720, P2721, P2728, P2729, or P2730 is not set.
 - **If the DTC is set**
 Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - **If the DTC is not set**
3. Perform the [Transmission Fluid Level and Condition Check](#) to verify correct fluid level and condition.
4. Perform the [Line Pressure Check](#) to verify correct oil pressure.
5. Operate the vehicle in Dual Electric Motors and Dual Electric Motors and ICE mode. The Clutch 1 Slip Speed parameter reading should be less than 200 RPM when the Clutch 1 Status parameter reading is Applied.

- If clutch slip speed is greater than 200 RPM

Refer to Component Testing.

- If clutch slip speed is less than 200 RPM

6. All OK

Component Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Verify control solenoid valve assembly condition by performing the [Control Solenoid Valve Inspection](#).
3. Verify control solenoid valve assembly function by performing the [Control Solenoid Valve Performance Test](#).

- If a concern is found

Replace the Q8 Control Solenoid Valve Assembly.

- If no concern is found

4. Inspect the a/trans fluid level control valve for stuck closed or damaged condition.

- If you found a concern with the a/trans fluid level control valve

Replace the a/trans fluid level control valve.

- If no concern is found

5. Inspect the valve body components and hydraulic circuits listed below for a leak or a stuck valve, refer to

Control Valve Body Diagnostic Inspection:

- Control valve body spacer (w/gasket) plate assembly
- Variable Low clutch and drive motor/generator stator cooling regulator valve
- **If you found a concern in the valve body**

Repair or replace the valve or valve body.

- **If no concern is found**

6. Inspect the Variable Low clutch assembly snap ring, piston, clutch discs, and housing for a slipping or damaged condition.

- **If you found a Variable Low clutch assembly concern**

Repair or replace the Variable Low clutch assembly as necessary.

- **If no concern is found**

7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Valve Body Replacement** for control valve body replacement
- Refer to **Variable Low Clutch Plate Removal**, and **Variable Low Clutch Plate Installation** for Variable Low Clutch Assembly replacement
- Refer to **Control Module References** for T6 Power Inverter Module replacement, programming, and setup.
- Refer to **Solenoid Valve Characterization Reprogramming** when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the **Reset Transmission Adapts** following all transmission related repairs.

DTC P179D: TRANSMISSION CLUTCH 2 MINOR SLIP DETECTED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P179D

Transmission Clutch 2 Minor Slip Detected

Typical Scan Tool Data

Variable Hi Clutch Reference

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0 - 80 km/h (0 - 50 mph)			

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Parameter Normal Range: 0 - 6,000 RPM			
Clutch 2 Slip Speed	0 RPM	0 - 6,000 RPM	0 - 6,000 RPM
Clutch 2 Status	Applied	Released	Applied

Circuit/System Description

The hybrid/EV powertrain control module 1 monitors Clutch 2 Slip Speed for each Hybrid Transmission Mode Commanded state. The hybrid/EV powertrain control module 1 monitors clutch slip when the variable high clutch is commanded ON.

Conditions for Running the DTC

Variable high clutch is applied.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 detects the variable high clutch adapt is exceeded 10 times.

Action Taken When the DTC Sets

DTC P179D is a Type B DTC.

Conditions for Clearing the DTC

DTC P179D is a Type B DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Transmission Internal Mode Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C	Signal P	Signal S
------------------------	----------	----------	----------	----------	----------

Gear Selector Position	Signal A	Signal B	Signal C	Signal P	Signal S
Park (P)	High	Low	High	Low	Low
Reverse (R)	Low	High	High	Low	High
Neutral (N)	Low	High	Low	High	Low
Drive (D)	High	Low	Low	High	High
Low (L)	High	Low	Low	High	Low

Circuit/System Description

The transmission internal mode switch, often referred to as the automatic transmission manual shift shaft position switch, is a hall-effect switch attached to the transmission case within the transmission. The 5 outputs from the switch indicate which position is selected by the transmission manual shaft. Five outputs (A, B, C, P, S) are range selection inputs to the hybrid/EV powertrain control module 1. The input voltage at the modules is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as Internal Mode Switch A/B/C/P/S. The Internal Mode Switch Range input parameters represented are transmission range signal A, signal B, signal C, and signal P signal S. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

- No Output Shaft Speed DTCs P0722 or P077B.
- The system voltage is 9 - 32 V.

Conditions for Setting the DTC

Any one or more of the following conditions:

- The Internal Mode Switch signal circuit A, B, P or S are Low in Park for greater than 8 s.
- The Internal Mode Switch signal circuit A is Low in D for 8 s.
- The Internal Mode Switch signal circuit C is High in D for 8 s.
- The hybrid/EV powertrain control module 1 detects an invalid range from the Internal Mode Switch for 3.25 s.
- The Internal Mode Switch signal circuit C is high in D for greater than 8 s.
- Park/Neutral Switch equals P/N and the Internal Mode Switch state is not Park or Neutral, or the Park/Neutral switch is not Park or Neutral and the Internal Mode Switch state equals Park or Neutral for 4 s.
- Or the transmission internal mode switch indicates a transitional state for 8 s.

Action Taken When the DTC Sets

- The PRNDL position indicator on the instrument cluster will be blank.
- The hybrid/EV powertrain control module 1 may command neutral if multiple circuit faults exist.

Conditions for Clearing the DTC

- DTC P182E is a Type A DTC.
- DTCs P1824, P182A-P182D, P182F, P1838-P1841, P18B5-18B9, P18BA, P18BC, P18BF, P18C0, P18C2, and P18C3 are Type B DTCs.

Diagnostic Aids

The transmission internal mode switch connects electrically to the control solenoid valve assembly. Inspect the transmission internal mode switch, harness, connector, and control solenoid assembly pins for metallic debris. Use a terminal test kit for any test that requires probing the control solenoid assembly harness connector or a component harness connector. The transmission internal mode switch can be damaged by currents exceeding 2 mA. Test the transmission internal mode switch for an open condition whenever a short to voltage condition is observed.

Circuit/System Verification

1. Vehicle ON, observe the scan tool Internal Mode Switch A/B/C/P parameter while moving the gear shift lever from Park, through all gear selector positions, and back to Park. The parameter should match each gear range that is selected. Refer to [Transmission Internal Mode Switch Logic](#).
2. Verify all the Internal Mode Switch Status parameters display Valid while moving the gear shift lever from Park, through all gear selector positions, and back to Park.
 - **If any of the parameters display Invalid**

Refer to Circuit/System Testing.
 - **If all the parameters display valid**
3. Verify all the Internal Mode Switch parameters display 1.62V - 2.49V when High and 0.66V - 1.02V when Low.
 - **If any of the parameters display outside of the specified range**

Refer to Circuit/System Testing.
 - **If all the parameters display within the specified range**

4. Perform the [Range Selector Lever Cable Adjustment](#) procedure to verify proper adjustment.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify [DTC P1824, P182A-P182F, P1838-P1841, P18B5-P18BA, P18BC, P18BF, P18C0, P18C2, or P18C3](#) is not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.
 - **If none of the DTCs are set**
7. All OK

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Vehicle OFF, remove the control valve body cover. Refer to [Control Valve Body Cover Replacement](#).
2. Disconnect the harness connector at the B15 Transmission Internal Mode Switch.
3. Vehicle in Service Mode.
4. Test for 8.3V to 9.4V between both 9 V reference circuits terminal 1, terminal 8 and ground.
 - **If not within the specified range**

Test the voltage circuits for an open/high resistance end to end.
 - If 2 Ω or greater, replace the A/Trans Wiring Extension Harness Assembly.
 - If 2 Ω or less, replace the T6 Power Inverter Module.
 - **If within the specified range**
5. Vehicle ON.
6. Install a 3 A fused jumper wire between each signal circuit listed below and the 9 V reference circuit:
 - Switch Signal A: terminal 2 and terminal 1
 - Switch Signal B: terminal 6 and terminal 8
 - Switch Signal C: terminal 3 and terminal 1
 - Switch Signal P: terminal 7 and terminal 8
 - Switch Signal S: terminal 5 and terminal 8
7. Verify each scan tool Internal Mode Switch A/B/C/P/S voltage parameter displays 4.88 - 5.12 V when jumped.
 - **If any parameter does not display 4.88 - 5.12 V when jumped**

Test the signal circuit for an open/short to voltage or short together.
 - If an open/short to voltage or short together is found, replace the Automatic Transmission Wiring Harness - Shift Shaft Position Switch.
 - If an open/short to voltage or short together is not found, replace the T6 Power Inverter Module.
 - **If each signal circuit parameter displays 4.88 - 5.12 V when jumped**
8. Replace the B15 Transmission Internal Mode Switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

NOTE: Perform the [Control Solenoid Valve Inspection](#) for the following components before replacing the components.

- Refer to [Manual Shift Shaft and Manual Shift Detent Lever Replacement](#) for B15 Transmission Internal Mode Switch, often referred to as the Automatic Transmission Manual Shift Detent Lever with Shaft Position Switch Assembly, replacement.
- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#) for Automatic Transmission Wiring Harness - Shift Shaft Position Switch replacement.
- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P215B: VEHICLE SPEED - OUTPUT SHAFT SPEED NOT PLAUSIBLE

Signal	OK	OK	OK
Supply Voltage	OK	Out of range	Out of range
8.3 - 9.3 Volts = OK, Any other voltage = Out of range			

Circuit/System Description

The A/Trans Output Speed Sensor Assembly has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The output speed sensor is internal to the transmission and mounts to the A/Trans case assembly and is connected to the hybrid/EV powertrain control module 1 through the control solenoid valve assembly and transmission internal harness. The A/Trans Output Speed Sensor Assembly faces the park gear machined teeth surface. The sensor receives 5.0 volts on the OSS supply voltage circuit from the hybrid/EV powertrain control module 1. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The two sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the hybrid/EV powertrain control module 1 for speed and direction and is transmitted through the serial data circuits to the engine control module (ECM). The ECM, hybrid/EV powertrain control module 1, compare the output speed sensor signal with the anti-lock brake system (ABS) wheel speed sensor signal. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- The vehicle speed is greater than 20 km/h (12.42 mph).
- The vehicle is not in Park or Neutral.

Conditions for Setting the DTC

ECM

The ECM OSS signal and the ABS wheel speed sensor signals differ by greater than 10 km/h (6.2 mph) for more than 25 ms.

Hybrid/EV Powertrain Control Module 1

The ECM OSS signal and the ABS wheel speed sensor signals differ by greater than 19 km/h (12 mph) for more than 10 seconds.

Action Taken When the DTC Sets

ECM

- The ECM commands reduced vehicle power.
- PROPULSION POWER REDUCED message is displayed on the driver information center.

Hybrid/EV Powertrain Control Module 1

The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

ECM

P215B is a Type A DTC.

Hybrid/EV Powertrain Control Module 1

P215B is a Type A DTC.

Diagnostic Aids

The hybrid system is very sensitive to the OSS signal for overall operation.

Circuit/System Verification

1. Inspect for broken driveline components.
2. Operate the vehicle at 16-32 km/h (10-20 mph) while observing the Transmission OSS and ABS wheel parameters on the scan tool.
 - ECM - The OSS signal and AS wheel speed signal displays should not vary by greater than 10 km/h (6.2 mph).
 - Hybrid/EV Powertrain Control Module 1 - The OSS and ABS wheel speed signal displays should not vary by greater than 19 km/h (12 mph).

Circuit/System Testing

1. Verify DTC C0035-C0050, C1207-C1210, C1221-C1228, C1232-C1235, C005A, C0245, C122E, P0721, P0723, U0073, U0074, U0077, U0101, U0129, or U1833 is not set.

- **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#).

- **If the DTCs are not set**

2. Program the control module which set the DTC with the latest software version and retest for DTCs.

- **If the DTC resets**

Replace the control module which set the DTC.

- **If the DTC does not reset**

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for K20 ECM or T6 Power Inverter Module, replacement, programming, and setup.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module is replaced.
- Refer to [Control Module References](#) for T6 Power Inverter Module, replacement, programming, and setup.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P215C: OUTPUT SHAFT SPEED - WHEEL SPEED NOT PLAUSIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P215C

Output Shaft Speed - Wheel Speed Not Plausible

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
OSS Supply Voltage	P215C	P0721, P215C	P0721, P215C	P077B, P0721, P215C
OSS Signal	P215C	P0721, P215C	P0721, P215C	P077B, P0721, P215C

Typical Scan Tool Data

Transmission OSS

Circuit	Normal Range	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature			
OSS Signal	0 - 7,000 RPM	0 RPM	0 RPM
OSS Supply Voltage	-	0 RPM	0 RPM

OSS Supply Voltage

Circuit	Normal Range	Open/High Resistance	Short to Voltage
Operating Conditions: Key ON, Engine OFF or Engine running, normal operating temperature			
OSS Signal	OK	OK	OK
OSS Supply Voltage	OK	Out of Range	Out of Range
8.3 - 9.3 Volts = OK, Any other voltage = Out of range			

Circuit/System Description

The A/Trans Output Speed Sensor Assembly has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The output speed sensor is internal to the transmission and mounts to the A/Trans case assembly and is connected to the hybrid/EV powertrain control module 1 through the control solenoid valve assembly and transmission internal harness. The A/Trans Output Speed Sensor Assembly faces the park gear machined teeth surface. The sensor receives 5.0 volts on the OSS supply voltage circuit from the hybrid/EV powertrain control module 1. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The two sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the hybrid/EV powertrain control module 1 for speed and direction and is transmitted through the serial data circuits to the engine control module (ECM). The ECM, hybrid/EV powertrain control module 1, compare the output speed sensor signal with the anti-lock brake system (ABS) wheel speed sensor signal. The hybrid/EV powertrain control module 1 is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- The vehicle is moving.
- The hybrid/EV powertrain control module 1 correlates the transmission output speed with the ABS wheel speed and motor speed to detect any failures in the transmission output speed sensor.

Conditions for Setting the DTC

- The difference between transmission output speed and the calculated average of output speed from the drive motors and ABS wheel speed sensors is greater than 50 RPM.
- The difference between the average of wheel speed sensors and drive motors and the output speed sensor is greater than 60 RPM.

Action Taken When the DTC Sets

- P215C is a Type B DTC.

- The hybrid/EV powertrain control module 1 calculates output speed based drive motor 2 speed if ABS wheel speed is not available.

Conditions for Clearing the DTC

P215C is a Type B DTC.

Special Tools

EL 38522 Variable Signal Generator

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

Operate the vehicle at 16 - 32 km/h (10 - 20 mph) while observing the Transmission OSS and ABS wheel parameters on the scan tool. The Transmission OSS and ABS wheel speed signal parameters should not vary by greater than 10 km/h (6 mph).

Circuit/System Testing

1. Verify DTC C0035-C0050, C1207-C1210, C1221-C1228, C1232-C1235, C005A, C0245, or C122E is not set in the electronic brake control module.
 - **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

2. Perform the [Output Shaft Speed Input Test](#).

- If the DTC does not set

3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Perform the [Drive Motor Removal - 2nd Position](#), and [Drive Motor Installation - 2nd Position](#) for OSS replacement.
- Refer to [Control Module References](#) for Drive Motor Generator Power Inverter Module, also called the power inverter module replacement.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P2670 OR P2671: ACTUATOR HIGH CONTROL CIRCUIT GROUP 2 VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P2670

Actuator High Control Circuit Group 2 Low Voltage

DTC P2671

Actuator High Control Circuit Group 2 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P2670	P2671	P2670, P2671	-

Typical Scan Tool Data

High Side Drive 2

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition On Parameter Normal Range: On			
High Side Driver 2	Off	On	Off

Circuit/System Description

The high side driver 2 is internal to the Hybrid/EV powertrain Control Module 1. With the ignition On, the high side

driver 2 provides 12 V to the transmission control solenoid valve. If excessive current flow is detected in high side driver 2 circuit, the high side driver 1 will turn Off. When the circuit fault is corrected, the high side driver 1 will reset. The hybrid/EV powertrain control module 1 and both drive motor control modules are internal to the power inverter module, often referred to as the drive motor generator power inverter module, and not serviced separately.

Conditions for Running the DTC

High side driver 2 is On.

Conditions for Setting the DTC

P2670

Hybrid/EV powertrain Control Module 1 has detected a short to ground on the high side driver 2 circuit during Hybrid/EV powertrain Control Module 1 initialization.

P2671

Hybrid/EV powertrain Control Module 1 has detected a short to voltage on the high side driver 2 circuit during Hybrid/EV powertrain Control Module 1 initialization.

Actions Taken When the DTC Sets

P2670

- DTC P2670 is a Type A DTC.
- The hybrid/EV powertrain control module 1 inhibits clutch 2.

P2671

DTC P2671 is a Type B DTC.

Conditions for Clearing the DTC

- DTC P2670 is a Type A DTC.
- DTC P2671 is a Type B DTC.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool High Side Driver 1 Command parameter displays On.
 - **If On is not displayed**

Refer to Circuit/System Testing.
 - **If On is displayed**
3. Verify the parameters listed below do not display Malfunction when commanding the high side driver 2, On and Off with a scan tool.
 - High Side Driver 2 Circuit Low Voltage Test Status
 - High Side Driver 2 Circuit Open Test Status
 - High Side Driver 2 Circuit High Voltage Test Status
 - **If Multifunction is displayed**

Refer to Circuit/System Testing.
 - **If Multifunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observe from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
6. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).
2. Remove the Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#).
3. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the Q8 Control Solenoid Valve.
4. Connect the 12 V battery.
5. Ignition ON, connect a test lamp between the high side driver circuit X1 terminal 7 and the ground.
6. Verify the test lamp turns ON.

• **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, replace the Automatic Transmission Wiring Harness - Control Solenoid Valve.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, replace the Automatic Transmission Wiring Harness - Control Solenoid Valve.
 - If less than 2 Ω , replace the T6 Power Inverter Module.

• **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the T6 Power Inverter Module, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the T6 Power Inverter Module.

• **If the test lamp turns ON and OFF**

7. Test or replace the Q8 Control Solenoid Valve.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for T6 Power Inverter Module replacement, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming, and setup.
- Refer to [Control Solenoid Valve Replacement](#) for Q8 Control Solenoid Valve replacement.
- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#) for Automatic Transmission Wiring Harness - Control Solenoid Valve replacement.
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module is replaced.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

DTC P27A7: TRANSMISSION CONTROL SOLENOID VALVE 1 CALIBRATION INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P27A7

Transmission Control Solenoid Valve 1 Calibration Incorrect

Circuit/System Description

The transmission control solenoids in this transmission require unique electrical current vs. oil pressure performance matching data values in order to function at maximum performance and efficiency. This data is programmed and stored in the Hybrid/EV Powertrain Control Module 1. When a transmission assembly, transmission line pressure control solenoid, or Hybrid/EV Powertrain Control Module 1 is replaced, the Hybrid/EV Powertrain Control Module 1 must be programmed with the new or existing solenoid performance data.

Conditions for Running the DTC

- Ignition On.
- T6 Hybrid/EV Powertrain Control Module 1 has completed initialization.

Conditions for Setting the DTC

Transmission control solenoid valve 1 matching performance data is not programmed into the Hybrid/EV Powertrain Control Module 1.

Action Taken When the DTC Sets

- P27A7 is a Type A DTC.
- The vehicle will not start.

Conditions for Clearing the DTC

P27A7 is a Type A DTC.

Diagnostic Aids

Obtain the replacement solenoid information code for the solenoid that was replaced, from the TIS Service Information web site.

Circuit/System Verification

NOTE: P27A7 is a informational DTC.

NOTE: Solenoid performance data is only available for the variable force solenoid, not the On/Off solenoids.

1. If the T12 Automatic Transmission Assembly or the line pressure control solenoid was replaced.
 - Obtain the solenoid performance data for the variable force solenoids from the TIS Service Information web site. Program the data into the existing T6 Hybrid/EV Powertrain Control Module 1. Perform the Transmission Service Fast Learn Procedure.
 - If the T12 Automatic Transmission was not replaced.
2. If the T6 Hybrid/EV Powertrain Control Module 1 was replaced.
 - Obtain the existing solenoid performance data for the variable force solenoids from the TIS Service Information web site. Program the data into the new T6 Hybrid/EV Powertrain Control Module 1. Perform the Transmission Service Fast Learn Procedure.
 - If the T6 Hybrid/EV Powertrain Control Module 1 was not replaced.

3. If the line pressure variable force solenoid was replaced.

- Obtain the solenoid performance data from the TIS Service Information web site for the new solenoids. Program the data into the existing T6 Hybrid/EV Powertrain Control Module 1.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Perform the [Solenoid Valve Characterization Reprogramming](#).
- Refer to [Control Module References](#) for T6 Hybrid/EV Powertrain Control Module 1 replacement, programming and setup.

SOLENOID VALVE CHARACTERIZATION REPROGRAMMING

The solenoids in this transmission require unique performance characteristic data in order to function at maximum efficiency. This data is programmed and stored in the vehicle's hybrid/EV powertrain control module 1. When a transmission assembly, hybrid/EV powertrain control module 1, valve body, or line pressure control solenoid are replaced during service, the performance characteristic data for the solenoids must be retrieved from a web server "cloud" repository and reprogrammed into the hybrid/EV powertrain control module 1.

Reprogramming also ensures that the characteristic data relationship is properly matched between the solenoids, valve body, and transmission.

Solenoid characterization reprogramming is performed using the TIS2Web Service Programming System (SPS).

Solenoid Reprogramming Procedure

Perform solenoid characterization reprogramming after one of the following service procedures:

NOTE: Select "Replace Transmission" at the MCVM Characterization selection screen.

- Replace transmission assembly

NOTE: Select "Replace Valve Body" at the MCVM Characterization selection screen.

- Replace valve body assembly

NOTE: Select "Replace Solenoid" at the MCVM Characterization selection screen.

- Replace solenoid - currently not an available Service Procedure

NOTE: Select "Refresh Characterization Data" at the MCVM Characterization selection screen.

- Replace T6 Power Inverter Module

NOTE: Select "Refresh Characterization Data" at the MCVM Characterization selection screen.

- Solenoid characterization may also be performed to "refresh" characterization data.

To perform solenoid characterization after a transmission component replacement:

1. Document the new Transmission Unique Number (TUN) or Part Unique Number (PUN) as required. Refer to [Transmission Identification Information](#).
2. Log into TIS2Web/SPS.
3. Type the vehicle identification number (VIN).
4. Select "T6 Power Inverter Module - MCVM Operations".
5. Select the applicable service procedure performed and provide the necessary TUN or PUN. At this point, the system will read the VIN from the engine control module (ECM) using the multiple diagnostic interface (MDI) and then retrieve the applicable genealogy data tree from the cloud. This data tree accesses the original characterization data so that it may be updated with the new component information. The system acquires characterization data for the given TUN/PUN via the cloud and updates the genealogy tree. The hybrid/EV powertrain control module 1 is updated with the correct solenoid characterization data, and the cloud is updated with the new genealogy relationship.

SYMPTOMS - AUTOMATIC TRANSMISSION

NOTE: Use the symptom tables only if the following conditions are met:

- Refer to [Diagnostic Starting Point - Vehicle](#) .
- There are no DTCs set.
- The control modules can communicate via the serial data link.
- Review the system operation in order to familiarize yourself with the system functions. Refer to [Transmission General Description](#), and [Transmission Component and System Description](#).

Visual/Physical Inspection

Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Fluid Diagnosis
 - [Transmission Fluid Level and Condition Check](#)
 - [Fluid Leak Diagnosis](#)
- Noise and Vibration Diagnosis
 - [Whine/Growl Noise That Changes with Vehicle Speed](#)
 - [Noise in Drive or Reverse Gear](#)

REGENERATIVE BRAKING ON DEMAND MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Regenerative Braking On Demand

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Normal Range = Inactive/Active				
Regenerative Braking On Demand Switch Circuit	P152D	Regenerative Braking On Demand Malfunction	Regenerative Braking On Demand Malfunction	P152C

Circuit/System Description

Regenerative Braking On Demand enables drivers to actively re-capture energy when slowing down, such as when approaching slower traffic or setting up for a tight turn. To engage Regenerative Braking On Demand, the driver releases the accelerator pedal and pulls back on the left steering-wheel paddle to begin regenerating electricity. When engaged, Regenerative Braking On Demand provides vehicle deceleration that is greater than what a typical vehicle experiences while coasting or when the transmission shifter is in the L position, providing control and dynamic

performance characteristics similar to downshifting in a manual-transmission vehicle. The feature does not bring the vehicle to a complete stop. Releasing the paddle cancels the Regeneration on Demand request, allowing the vehicle to coast normally. The driver can engage and disengage Regeneration on Demand as desired and as traffic conditions allow. When Regenerative Braking On Demand is requested, a signal is sent to the Body Control Module and then to the hybrid/EV powertrain control module 1 via serial data. The Regenerative Braking On Demand parameter is displayed as Inactive and Active on the scan tool. The Regenerative Braking On Demand parameter states are listed below:

- Inactive - when no switch is pressed
- Active - when the S2L automatic transmission manual shift switch-left is activated.

Diagnostic Aids

The Regenerative Braking On Demand feature has a maximum of 60kW charging power. Performance may be reduced when the high voltage battery is cold and/or the high voltage battery is fully charged. The following conditions listed below will reduce or inhibit Regenerative Braking On Demand performance:

- The high voltage battery is warmer than 20Â°C (68Â°F), and battery state of charge is greater than 80%.
- The high voltage battery is warmer than 10Â°C (50Â°F), and battery state of charge is greater than 75%.
- The high voltage battery is warmer than 0Â°C (32F), and battery state of charge is greater than 60%.
- The high voltage battery is colder than -10Â°C (14Â°F).
- If the battery state of charge is greater than 90%, Regenerative Braking On Demand is inhibited.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify with a scan tool the following hybrid/EV powertrain control module 1 Regenerative Braking On Demand parameter displays the correct values for the S2L automatic transmission manual shift switch-left state:
 - Regenerative Braking On Demand parameter displays Inactive when not activated.
 - Regenerative Braking On Demand parameter displays Active when activated.
 - **If the hybrid/EV powertrain control module 1 parameter is incorrect**

Refer to Circuit/System Testing.
 - **If the Regenerative Braking On Demand parameter is correct**
2. If the vehicle passes the Circuit/System Verification procedure then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Circuit/System Testing

1. Vehicle OFF, disconnect the S2L automatic transmission manual shift switch-left wire harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the following harness side ground circuit and ground:

S2L automatic transmission manual shift switch-left X1 terminal 3.
 - **If 10 Ω or greater**

Test for less than 2 Ω in the ground circuit end to end.
 - If greater than 2 Ω , repair the Open/High resistance in the circuit.
 - If less than 2 Ω , repair the ground connection.
 - **If less than 10 Ω**
3. Vehicle ON, test for 11 - 13 volts between X1 terminal 2 harness connector and ground.
 - **If not within the specified value**

Test the voltage circuit end to end for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
 - **If within the specified value**
4. Vehicle OFF, test for 0.8 - 1.2 k Ω between terminal 1 and terminal 2 on the S2L automatic transmission manual shift switch-left, with the switch closed.
 - **If not within the specified value**

Replace the S2L automatic transmission manual shift switch-left.
 - **If within the specified value**
5. Replace the K9 BCM.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Refer to [Steering Wheel Replacement](#) for S2L automatic transmission manual shift switch-left replacement.

- Refer to [Control Module References](#) for K9 body control module replacement, programming, and setup.

CONTROL SOLENOID VALVE INSPECTION

Fig. 21: Control Solenoid Valve Assembly

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Transmission Fluid Temperature Sensor
2	Pressure Control Solenoid Valve 2
3	Pressure Control Solenoid Valve 5
4	Electrical Connector - 8 Pins
5	Pressure Control Solenoid Valve 3
6	Pressure Control Solenoid Valve 4

1. Inspect the control solenoid valve assembly connectors and the 8 electrical connector pins for the following conditions:
 - Damage
 - Bent pins
 - Debris
 - Broken retaining tab
 - Contamination
2. Ensure no metallic debris is inside the connectors near the terminal pins.
3. Inspect the control solenoid valve assembly solenoid leads for contamination or metallic debris.
4. Inspect the control solenoid valve assembly filter plate and retaining tabs for cracks and ensure proper tension when a new filter plate is attached.

OUTPUT SHAFT SPEED INPUT TEST

Special Tools

EL 38522 Variable Signal Generator

For equivalent regional tools, refer to [Special Tools](#).

The purpose of this test is to provide a simulated output speed sensor signal to the control solenoid valve assembly Transmission Output Shaft Speed Sensor input circuits in order to verify the control solenoid valve assembly is able to process the output speed sensor signal.

1. Vehicle OFF, remove the control valve body cover. Refer to [Control Valve Body Cover Removal](#).
2. Vehicle OFF, disconnect the Automatic Transmission Wiring Harness - Control Solenoid Valve from the OSS wiring harness.
3. Vehicle ON, test for 8.3 - 9.3 volts between terminals 1 and 2.

- **If not within the specified range**

Test the Automatic Transmission Wiring Harness - Control Solenoid Valve for an open, short to ground or short to voltage. If the harness tests OK, replace the T6 Power Inverter Module.

- **If within the specified range**

4. Vehicle OFF, using the **EL 35616** terminal test kit, connect the **EL 38522** variable signal generator red lead to the OSS signal circuit terminal 2 on the Automatic Transmission Wiring Harness - Control Solenoid Valve.
5. Connect the black lead from the **EL 38522** variable signal generator to ground.
6. Set the **EL 38522** variable signal generator to 8 volts, the frequency to 120 Hz, and the percent duty cycle to 50 or the normal position.
7. Vehicle ON, verify with a scan tool the Transmission OSS parameter is between 375 - 400 RPM.

- **If not within the specified range**

Replace the T6 Power Inverter Module.

- **If within the specified range**

8. Test the Automatic Transmission Wiring Harness - Control Solenoid Valve for an open, short to ground or short to voltage.

- **If Automatic Transmission Wiring Harness - Control Solenoid Valve is shorted or open**

Replace the Automatic Transmission Wiring Harness - Control Solenoid Valve harness.

- **If all circuits test normal**

9. Test or replace the B14A Transmission Output Shaft Speed Sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#), and [Control Valve Assembly and Transmission Wiring Harness Installation](#).
- Refer to [Drive Motor Removal - 2nd Position](#), and the [Drive Motor Installation - 2nd Position](#) for OSS replacement.

- Refer to [Control Module References](#) for T6 Power Inverter Module replacement, programming, and setup.

CONTROL SOLENOID VALVE PERFORMANCE TEST

The purpose of this procedure is to test the functionality of the control solenoid valve solenoids for a stuck open or stuck closed condition, or a faulty transmission fluid temperature sensor.

Preliminary Procedures

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#).
2. Remove the control solenoid valve assembly from the transmission. Refer to [Control Solenoid Valve Replacement](#).
3. Perform the [Control Solenoid Valve Inspection](#) procedure.

Solenoid Testing Procedure

Fig. 22: Control Solenoid Valve Assembly
Courtesy of GENERAL MOTORS COMPANY

Control Solenoid Valve

Callout	Component Name	Normal Resistance	Terminal	DTC/Symptom
1	Transmission Fluid Temperature Sensor	Temperature Versus Resistance (Transmission Fluid Temperature Sensor)	X1 Terminal 3, X1 Terminal 4	P0711, P0712, or P0713
2	Pressure Control Solenoid Valve 2	23 - 24 Ω	X1 Terminal 2, X1 Terminal 7	P0964, P0966, or P0967
3	Pressure Control Solenoid Valve 5	23 - 24 Ω	X1 Terminal 5, X1 Terminal 7	P2727, P2729, or P2730

Callout	Component Name	Normal Resistance	Terminal	DTC/Symptom
4	Electrical Connector - 8 Pins	-	-	-
5	Pressure Control Solenoid Valve 3	23 - 24 Ω	X1 Terminal 8, X1 Terminal 7	P0968, P0970, or P0971
6	Pressure Control Solenoid Valve 4	23 - 24 Ω	X1 Terminal 6, X1 Terminal 7	P2718, P2720, or P2721

DTC P0711, P0712, or P0713

1. Measure the transmission fluid temperature sensor resistance between X1 Terminal 3 and X1 Terminal 4, refer to [Temperature Versus Resistance \(Transmission Fluid Temperature Sensor\)](#).

- **If the resistance is not within the specified range**

Replace the Q8 Control Solenoid Valve Assembly.

- **If the resistance is within the specified range**

2. Test the transmission internal harness for an open, short to ground, or short to voltage. If the transmission internal harness tests OK, replace the T6 Power Inverter Module.

DTC P079A, P079B, P079C, P07A3, P07A5, P179C, P179D

1. Measure each pressure control solenoid valve for 23 - 24 Ω .

- **If the resistance is not within the specified range**

Replace the Q8 Control Solenoid Valve Assembly.

- **If the resistance is within the specified range**

2. With a rubber tipped blow gun, pressurize the line pressure side of each solenoid fluid passage of the Q8 control solenoid valve assembly. When the solenoid is not energized, air should not leak out of the exhaust port.
3. One at a time, energize each solenoid with a 12 V source. With a rubber tipped blow gun, pressurize the line pressure side of each solenoid fluid passage of the Q8 control solenoid valve assembly. When the solenoid is energized, air should leak out of the exhaust port.

- **If the Q8 control solenoid valve assembly fails any of the above tests**

Replace the Q8 Control Solenoid Valve Assembly.

- **If the Q8 control solenoid valve assembly passes the above tests**

The concern is internal to the transmission.

4. Repair as necessary.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Valve Assembly and Transmission Wiring Harness Removal](#) for Q8 Control Solenoid Valve replacement.

- Refer to [Control Module References](#) for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup.
- Perform the [Reset Transmission Adapts](#) following all transmission related repairs.

RESET TRANSMISSION ADAPTS

Reset Transmission Adapts is a procedure for automatic transmissions in which a series of tests are run to allow the hybrid/EV powertrain control module 1 to learn individual clutch characteristics. Once the clutch data is learned, Reset Transmission Adapts translates it into the adaptive data cells, which the hybrid/EV powertrain control module 1 uses for clutch control during shifts. The scan tool provides initiation of the Reset Transmission Adapts procedure. This procedure is to be used following transmission repair.

The Reset Transmission Adapts procedure must be performed when one of the following repairs have been made to the vehicle. Failure to perform the procedure after one of the following repairs may result in poor transmission performance, as well as transmission DTCs being set:

- Transmission internal service/overhaul
- Valve body repair or replacement
- Control solenoid valve assembly replacement
- Hybrid/EV powertrain control module 1 software/calibration update
- Any service in response to a shift quality concern

NOTE: Ensure the following conditions are met before performing the Reset Transmission Adapts procedure:

- Drive wheels are blocked
- Parking brake is applied
- Service brake is applied
- Zero percent throttle and no external engine RPM control
- Transmission fluid temperature is between 70 - 115°C (158 - 239°F)
- Transmission gear selector has been cycled from Park to Reverse 3 times in order to purge air from the clutches.

NOTE: If at any time during the procedure, required conditions are not met, Reset Transmission Adapts may abort and the process may need to be started again from the beginning. If this occurs, the transmission will be left in a neutral state until the controller is shut down, vehicle OFF and remove the scan tool and wait for more than 30 seconds prior to re-try procedure. If the procedure repeatedly fails, a limit that engineering set is being exceeded and there is possibly a transmission hardware issue.

1. Use the scan tool to perform the Reset Transmission Adapts procedure. As the procedure is being performed, the scan tool data display will provide operator instructions. Follow the scan tool instructions as required.
2. Once the procedure is complete, vehicle OFF and power down the hybrid/EV powertrain control module 1. You will lose communication to the scan tool.

Ensure you exit back to the main screen in the scan tool, shut the scan tool OFF, and unplug it from the DLC or the hybrid/EV powertrain control module 1 may not shut down leaving the vehicle in a neutral state.

NOTE: When the Reset Transmission Adapts procedure is completed, the transmission will remain in a neutral state until the controller shuts down. If after 1 - 2 minutes of sitting, with the vehicle OFF and scan tool removed, the vehicle remains in a neutral state, disconnect the battery and wait 5 - 10 minutes and then connect the battery. Reverse and drive should return.

3. Vehicle ON. This will complete the Reset Transmission Adapts procedure.
4. Perform the [Road Test](#).

Troubleshooting

If the Reset Transmission Adapts will not run and the above stated conditions have been met, ensure the following:

- Transmission Fluid Temperature parameter is between 40 - 60°C (104 - 140°F).
- Brakes and brake switch are functioning properly.
- No active DTCs.
- Park/Neutral position switch is properly adjusted and functioning.
- Line pressure control is able to provide 1000 kPa and is within specifications.
- Vehicle is not moving, or vibrating excessively.
- Clutches are properly assembled.

CONTROL VALVE BODY DIAGNOSTIC INSPECTION

The purpose of this inspection procedure is to determine if the control valve body assembly is the cause of a transmission DTC or symptom concern. The table will assist you in identifying which component within the control valve body is associated with a particular DTC or symptom. The components within the control valve body are not serviced separately.

Component Testing

WARNING: Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result.

CAUTION: After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels in order to dry any transmission components. Lint from the towels can cause component failure.

CAUTION: Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component.

1. Remove the control valve body assembly. Refer to [Control Valve Body Replacement](#).
2. Clean and inspect all control valve body assembly components for the following conditions listed below:
 - Stuck or scored control valve
 - Scored or damaged control valve body bore
 - Broken, weak, or damaged control valve return spring
 - Missing, damaged, or stuck check ball
 - Missing, restricted, or out of position modulated fluid pressure orifice
 - Missing or damaged control valve retainer

- Debris or sediment
 - If a condition is found, and cannot be repaired by cleaning
 Replace the control valve body assembly.
 - If a condition is not found

3. All OK

Repair Instructions

- Refer to [Control Valve Body Replacement](#)
- Refer to [Solenoid Valve Characterization Reprogramming](#) when the T6 Power Inverter Module, Valve Body, or Q23 Line Pressure Control Solenoid is replaced.

TRANSMISSION FLUID LEVEL AND CONDITION CHECK

This procedure checks both the transmission fluid level, as well as the condition of the fluid itself.

CAUTION: The transmission fluid level must be checked when the transmission fluid temperature is at 45 - 55Â°C (113 - 131Â°F). If the transmission fluid temperature is not at this range, operate the vehicle or allow the fluid to cool as required. Setting the transmission fluid level with fluid temperature outside this range will result in either an under or over-filled transmission. Fluid temperature higher than 55Â°C will result in an under-filled condition. Fluid temperature lower than 45Â°C will result in an over-filled condition. An under-filled transmission will cause premature component damage. An over-filled transmission may cause fluid to discharge out the vent tube, fluid foaming, pump cavitation, or overheating. Transmission overheating may result in loss of vehicle propulsion without warning.

Initial Fluid Level Confirmation

Fig. 24: Transmission Fluid Filler Cap And Fluid Level Hole Plug

Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the transmission has enough fluid in it to safely start the vehicle without damaging the transmission. With the vehicle off and the transmission fluid temperature at approximately 20 - 25Â°C (68 - 77Â°F), there must be at least enough fluid to drain out of the fluid level hole.

1. Verify if transmission service has been performed.
2. If no transmission repair has been performed and no leaks are evident, proceed directly to the Final Level Checking Procedure below.
3. Following any transmission service, remove the fluid filler cap (1) and the fluid level hole plug (2).
 - If the fluid is flowing as a steady stream, wait until the fluid begins to drip.

NOTE: Service replacement transmissions may come shipped with up to 3L (3.2 Q) of fluid.

- If no fluid comes out, add fluid until fluid drips out. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#), and [Wire to Wire Repair - Engine Controls and Fuel](#).
4. Install the fluid level hole plug. Refer to [Fastener Specifications \(Off-Vehicle\)](#)[Fastener Specifications \(On-](#)

Vehicle).

NOTE: You must confirm fluid level at the proper temperature range.

5. Perform the Final Level Checking Procedure below.

Final Level Checking Procedure

NOTE: You may have to open the hood to maintain engine operation.

1. Start the engine.
2. Allow the engine to idle in Park (P).

NOTE: If the transmission fluid temperature reading is not at the required temperature, allow the vehicle to cool, or operate the vehicle until the appropriate range is reached. If the fluid temperature is below the specified range, driving the vehicle will raise the fluid temperature to the specification quicker than engine idling.

3. Keep the engine running and observe the transmission fluid temperature using the scan tool.
4. When the transmission fluid temperature is in the 45 - 55°C (113 - 131°F) range, move the shift lever through Park (P), Neutral (N) and Drive (D) 2 times and back to Park (P).
5. Raise the vehicle on a hoist. The vehicle must be level, with the engine running and the shift lever in the PARK range.

Fig. 25: Transmission Fluid Filler Cap And Fluid Level Hole Plug
Courtesy of GENERAL MOTORS COMPANY

6. While the vehicle is idling, remove the fluid level hole plug (2). Allow any fluid to drain.
 - If the fluid is flowing as a steady stream, wait until the fluid begins to drip.
 - If no fluid comes out, add fluid until fluid drips out.
 - Proper level is achieved when fluid slowly drips at a rate of 3 drips per second.
 - Reinstall the fluid level hole plug. Refer to **Fastener Specifications (Off-Vehicle)****Fastener Specifications (On-Vehicle).**

7. Inspect the fluid color. The fluid should be red or dark brown.
 - If the fluid color is very dark or black and has a burnt odor, inspect the fluid for excessive metal particles or other debris. Refer to [Road Test](#) to verify transmission operation. Change the transmission fluid if no other conditions are found.
 - Fluid that is cloudy or milky or appears to be contaminated with water indicates engine coolant or water contamination. Refer to [Engine Coolant/Water in Transmission](#).
8. Inspect for external leaks. Refer to [Fluid Leak Diagnosis](#)
9. If the fluid was changed, reset the transmission oil life monitor if applicable.

LINE PRESSURE CHECK

Special Tools

EN 21867-A Pressure Gauge

For equivalent regional tools refer to [Special Tools](#)

Main Line Pressure Check

Fig. 26: Transmission Fluid Pressure Test Hole Plug

Courtesy of GENERAL MOTORS COMPANY

WARNING: Keep the brakes applied at all times in order to prevent unexpected vehicle motion. Personal injury may result if the vehicle moves unexpectedly.

1. Install a scan tool.

NOTE: Depending on the hybrid/EV battery state of charge the engine may not start. To start or keep the engine running open the hood.

2. Start the engine.
3. If the engine will not start, refer to [Engine Will Not Crank - Crankshaft Will Not Rotate](#).
4. Inspect the transmission for the proper fluid level. Refer to [Transmission Fluid Level and Condition Check](#).
5. Inspect the manual linkage at the transmission for proper function.
6. Turn the engine OFF.

NOTE: You may need to remove or disconnect components in order to gain access to the transmission line pressure test hole plug.

7. Remove the line pressure test hole plug.
8. Install the **EN 21867-A** pressure gauge.
9. Access the Scan Tool Transmission Output Controls for the Line Pressure Control Solenoid.
10. Start the engine.

NOTE: In order to achieve accurate line pressure readings, the following procedure must be performed at least 3 times in order to gather uniform pressure readings. Also if you do not have the hood open the engine may go in to AutoStop.

The scan tool is only able to control the line Pressure Control solenoid in **PARK** and **NEUTRAL** with engine speeds below 1500 RPM. This protects the clutches from extreme high or low line pressures.

11. Use the scan tool to increase and decrease the Line Pressure Control Solenoid in increments of approximately 100 KPa (15 psi). The scan tool commands the increment values automatically.
12. Allow the pressure to stabilize between increments.
13. Compare your pressure readings on the scan tool to those indicated on the **EN 21867 - A** pressure gauge.
14. If the pressure readings vary greatly, refer to [Automatic Transmission Fluid Pump Pressure High or Low](#)
15. Install the pressure test hole plug. Tighten the pressure plug to 11 N.m (97 lb in).

DRIVE MOTOR POWER INVERTER MODULE FLUID SEAL PRESSURE TEST

Fig. 27: Drive Motor Power Inverter Module Fluid Seal Pressure Test
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Install Drive Motor Power Inverter Module. Refer to: Drive Motor Power Inverter Module Installation .	
1	Drive Motor Power Inverter Module Coolant Pipe CAUTION: Refer to Fastener Caution . Procedure 1. Install the drive motor power inverter module coolant pipe and bolts. Tighten the bolts to 9 N.m (80 lb in). 2. Clamp GE-48494 adapter kit components to the coolant outlet pipe. 3. Plug the coolant inlet pipe with the GE-48494 adapter kit plug and clamp. 4. Apply 20 psi (138 kPa) pressure with J-24460-01 pressure tester. 5. Monitor the pressure tester gauge for 5 minutes and ensure that pressure remains at the specified value. • If the specified pressure cannot be maintained, check the coolant hose and connections for leaks. If the coolant hose and connections check good, remove the drive motor power inverter module and replace the fluid seal. • If pressure remains at the specified value, proceed to the next step. 6. Remove all GE-48494 adapter kit components. Special Tools • GE-48494 Power Electronics Pressure Test Adapter Kit • GE-48494-10 Pressure Tester Kit • J-24460-01 Cooling System Pressure Tester For equivalent regional tools, refer to Special Tools.

ROAD TEST

NOTE: The Road Test Procedure should be performed only as part of the Symptom Diagnosis. Refer to [Symptoms - Automatic Transmission](#).

The following test provides a method of evaluating the condition of the automatic transmission. The test is divided into the following parts:

- Low Voltage Electrical Function Check
- Hydraulic Control Function Check
- High Voltage Electric Machine Control Function Check

NOTE: Complete the test in the sequence given.

Before the road test, ensure the following:

- The engine is performing properly.
- Transmission fluid level is correct. Refer to [Transmission Fluid Level and Condition Check](#).
- Tire pressure is correct.
- The high voltage battery is above 30% state of charge.

During the road test:

- Perform the test only when traffic conditions permit.
- Operate the vehicle in a controlled, safe manner.
- Observe all traffic regulations.
- To view the scan tool data while conducting this test, take along qualified help in order to operate the vehicle safely, or review the data after the drive audit.
- Observe any unusual sounds or smells.

After the road test, check the following:

- Inspect for proper transmission fluid level. Refer to [Transmission Fluid Level and Condition Check](#).
- Inspect for any diagnostic trouble codes (DTCs) that may have set during the testing. Refer to the applicable DTC.
- Monitor the scan tool data for any abnormal readings or data.
- Inspect for fluid leaks. Refer to [Fluid Leak Diagnosis](#).

Low Voltage Electrical Function Check

Perform this procedure first in order to ensure the electronic transmission components are functioning properly. If these components are not checked, a simple electrical condition could be misdiagnosed.

1. Connect the scan tool.
2. Ensure the gear selector is in PARK and set the parking brake.
3. Start the vehicle. To ensure the engine starts, open the hood.
4. With a scan tool, monitor the transmission data parameters and compare them to typical scan tool data definitions.

Refer to [Hybrid Powertrain Control Module Scan Tool Information](#) for typical data values. Data that is questionable may indicate a concern.

5. Monitor transmission range on the scan tool data list.
 1. Apply the brake pedal and ensure the parking brake is set.
 2. Move the gear selector through all ranges.
 3. Pause 2 to 3 seconds in each range.
 4. Return gear selector to PARK.
 5. Verify that all selector positions match the scan tool display.
6. Check accelerator position sensor input.
 1. Apply the brake pedal and ensure the parking brake is set while monitoring accelerator pedal data.
 2. Ensure the gear selector is in PARK.

3. Monitor the scan tool Accelerator Pedal Position while increasing and decreasing engine speed with the accelerator pedal. The scan tool Accelerator Pedal Position percentage should increase and decrease with engine speed.

If any of the above checks do not perform properly, record the result for reference after completion of the road test.

Hydraulic and Electric Machine Control Function Checks

NOTE: If in the above steps you opened the hood to start the engine make sure it is closed before driving the vehicle.

Charge vehicle to greater than 25% state of charge to enter EV only mode, if not already done. Perform the following steps while monitoring Hybrid/EV data list:

1. Drive vehicle at 35 mph at steady state.
2. Accelerate safely with 100% accelerator pedal to 55 mph, then drive at or above 55 mph.
 1. Monitor for any excessive variable low clutch slip speed during acceleration.
3. Slow vehicle by shifting to LOW or pressing the regenerative braking button.
4. Switch vehicle to Hold Mode to start the engine (if needed) by pressing the Drive Mode Button 4 times.
5. Drive vehicle below 35 mph with stop-and-go city driving.
 1. The engine will stop and start as needed.
 2. Ensure smooth operation free of excessive vibrations.
6. Accelerate safely with 100% accelerator pedal to 55 mph, then drive at or above 55 mph.
 1. Monitor for any excessive variable low clutch slip speed during acceleration.
 2. Ensure variable high clutch engages during 55 mph steady state driving and monitor for slip.
7. Slow vehicle by shifting to LOW or pressing the regenerative braking button.
 1. Ensure smooth deceleration as variable low clutch re-engages at lower vehicle speeds.

Reverse

Perform the following test safely:

1. With the vehicle stopped, move the gear selector to REVERSE.
2. Slowly accelerate the vehicle.
3. Verify that there is no noticeable slip, noise or vibration.
4. This test ensures the control system is properly applying torque in the reverse direction.

This procedure checks general functionality of the transmission. For diagnosing intermittent problems, try to duplicate the conditions of the original complaint. Refer to freeze frame records if a DTC set to determine the conditions.

CLUTCH PLATE DIAGNOSIS

Composition Plates

Dry the plates and inspect the plates for the following conditions:

- Pitting
- Flaking

- Delamination - splitting or separation of bonded clutch material
- Wear
- Glazing
- Cracking
- Charring
- Chips or metal particles embedded in the lining

Replace a composition plate which shows any of these conditions.

Steel Plates

Wipe the plates dry and check the plates for heat discoloration. If the surfaces are smooth, even if color smear is indicated, you can reuse the plate. If the plate is discolored with heat spots or if the surface is scuffed, replace the plate.

Causes of Burned Clutch Plates

The following conditions can result in a burned clutch plate:

- Incorrect usage of clutch or apply plates
- Engine coolant or water in the transmission fluid
- A cracked clutch piston
- Damaged or missing seals
- Low line pressure
- Valve body conditions
 - The valve body face is not flat.
 - Porosity is between channels.
 - The valve bushing clips are improperly installed.
 - The checkballs are misplaced.
- The Teflon® seal rings are worn or damaged.

ENGINE COOLANT/WATER IN TRANSMISSION

CAUTION: The antifreeze or water will deteriorate the seals, gaskets and the glue that bonds the clutch material to the pressure plate. Both conditions may cause damage to the transmission.

If antifreeze or water has entered the transmission, perform the following:

1. Disassemble the transmission.
2. Replace all of the rubber type seals. The coolant will attack the seal material which will cause leakage.
3. Replace the composition-faced clutch plate assemblies. The facing material may separate from the steel center portion.
4. Replace all of the nylon parts - washers.
5. Replace the torque dampener.
6. Thoroughly clean and rebuild the transmission, using new gaskets and oil filter.
7. Flush the cooler lines after the transmission cooler has been properly repaired or replaced.

CASE POROSITY REPAIR

Some external leaks are caused by case porosity in non-pressurized areas. You can usually repair these leaks with the transmission in the vehicle.

1. Thoroughly clean the area to be repaired with a cleaning solvent. Air dry the area.

WARNING: Epoxy adhesive may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.

2. Using instructions from the manufacturer, mix a sufficient amount of an epoxy to make the repair.
3. While the transmission case is still hot, apply the epoxy. You can use a clean, dry soldering acid brush to clean the area and also to apply the epoxy cement. Make certain that the area to be repaired is fully covered.
4. Allow the epoxy cement to cure for three hours before starting the engine.
5. Repeat the fluid leak diagnosis procedures.

BUSHING AND MATING SHAFT INSPECTION

NOTE: Proper bushing and corresponding mating shaft inspection should be performed before replacing the bushing, shaft, and in some cases, the component which houses the bushing. Thoroughly clean and dry the bushing and shaft surfaces before inspecting for damage.

Any of the following bushing conditions require replacement of the bushing and/or housing:

- Discoloration due to heat distress
- Misalignment or displacement of bushing as a result of spinning in housing
- Medium to heavy scoring that can be easily detected with fingernail. Light scoring is a normal condition.
- Debris embedded into the bushing lining material
- Obvious damage, including excessive and uneven wear
- Excessive polishing. Minor polishing of the bushing is an indication of normal wear and does not require replacement.

Any of the following conditions require replacement of the bushing's mating shaft:

- Discoloration due to heat distress
- Rough surface finish that can be easily detected with finger
- Obvious shaft abnormalities, including warping or uneven surfaces
- Obvious damage or cracking

AUTOMATIC TRANSMISSION FLUID PUMP PRESSURE HIGH OR LOW

Checks	Causes
Automatic Transmission Fluid Pump Motor	• Faulty fluid pump motor assembly • Faulty fluid pump motor wiring • Low fluid level • Inspect for leaking or damaged fluid pump outlet seal and fluid filter seal

Checks	Causes
	• Inspect for improperly installed or damaged fluid filter
Control Solenoid Valve	• Inspect for leaking or damaged control solenoid valve seals • Inoperable control solenoid valve • Inspect for damaged control solenoid electrical connector or wiring • Inspect for damaged or worn control solenoid valve accumulator or accumulator bore
Control Valve Assembly	• Inspect for leaking or damaged control valve body spacer plate • Inspect for damaged or stuck open line pressure blow-off ball valve • Inspect for a sticky or stuck line pressure regulator valve • Inspect solenoid module assembly for damage to plastic body or seal plate • Inspect for other sticky or stuck valves within the control valve assembly • Inspect for other leak paths within the line pressure hydraulic circuit or control valve solenoid hydraulic circuitry

AUTOMATIC TRANSMISSION FLUID LEAKS

Checks	Causes
Torque Dampener	Inspect for damage.
Case Assembly	• Inspect for porosity or damage on the sealing surfaces • Inspect for loose oil cooler line bolts or damaged oil cooler line seals • Inspect for damaged manual shift shaft seal • Inspect for damaged or worn drive shaft oil seals on the axle shafts • Inspect for loose pressure test plug and fluid level hole plug
Torque Dampener and Differential Housing Assembly	• Inspect for damaged torque dampener and differential housing assembly • Inspect for porosity or damage on the sealing surfaces • Inspect for damaged torque dampener and differential housing gasket • Inspect for loose torque dampener and differential housing bolts • Inspect for damaged or worn drive shaft oil seals on the axle shafts

Checks	Causes
Control Valve Body Cover	• Inspect for damaged or warped control valve body cover • Inspect for damaged fluid level control valve seal - gasket • Inspect for loose control valve body cover bolts.

FLUID LEAK DIAGNOSIS

General Method

1. Verify that the leak is transmission fluid.

CAUTION: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushings.

2. Thoroughly clean the suspected leak area using a rag.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the engine.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

CAUTION: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushings.

1. Thoroughly clean the suspected leak area using a rag.
2. Apply an aerosol type leak tracing powder to the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Shut OFF the engine.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

Dye and Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer's instructions in order to determine the amount of dye to use.
2. Operate the vehicle for 24 km (15 mi) or until normal operating temperatures are reached.
3. Detect the leak with the black light.
4. Make the necessary repairs.

Find the Cause of the Leak

Pinpoint the leak and trace the leak back to the source. You must determine the cause of the leak in order to repair the leak properly. For example, if you replace a gasket, but the sealing flange is bent, the new gasket will not repair the

leak. You must also repair the bent flange. Before you attempt to repair a leak, check for the following conditions, and make repairs as necessary:

Gaskets

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Improperly tightened fasteners
- Dirty or damaged threads
- Warped flanges or sealing surface
- Scratches, burrs, or other damage to the sealing surface
- Damaged or worn gasket
- Cracking or porosity of the component
- Improper sealant used, where applicable
- Incorrect gasket

Seals

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Damaged seal bore
- Damaged or worn seal
- Improper installation
- Cracks in component
- Manual shaft or output shaft surface is scratched, nicked, or damaged
- Loose or worn bearing causing excess seal wear

Possible Points of Fluid Leaks

Control Valve Body Cover

- Incorrectly tightened bolts
- Improperly installed or damaged gasket/seal
- Damaged mounting face
- Incorrect gasket seal

Case Leak

- Damaged manual shift shaft seal
- Loose or damaged oil cooler lines/seals
- Worn or damaged drive shaft oil seal
- Loose line pressure plug or fluid level hole plug
- Porous casting
- Warped torque dampener and differential housing
- Damaged torque dampener and differential housing gasket

Torque Dampener and Differential Housing

- Damaged torque dampener and differential housing gasket.
- Worn or damaged drive shaft oil seal
- Porous casting of the torque dampener and differential housing

Leak at the Vent

- Overfilled system
- Water or coolant in the fluid; The fluid will appear milky
- Transmission case porous
- Incorrect fluid level indicator causing an overfilled system
- Plugged vent

WHINE/GROWL NOISE THAT CHANGES WITH VEHICLE SPEED

Checks	Causes
Input Internal Gear Thrust Bearing	Inspect the bearing for wear or damage.
Output Carrier Thrust Bearing	• Inspect the carrier assembly for damaged pinion gears, pins, and rollers. • Inspect for damaged thrust bearings. • Inspect for damaged sun gears. • Inspect for damaged or stripped splines on the output carrier assembly.
Output Carrier Internal Gear Hub Thrust Bearing	Inspect the bearing for wear or damage.
Front Differential Carrier	Inspect for damaged gears and bearings.
Front Differential Carrier Bearing	Inspect the bearing for wear or damage.
Drive Link Assembly	Inspect for damaged sprockets, bearings, and drive link.

NOISE IN DRIVE OR REVERSE GEAR

Checks	Causes
Variable Low Clutch Assembly	• Inspect for damaged or worn variable low clutch plates. • Inspect for damaged variable low clutch backing plate. • Inspect for damaged variable low clutch backing plate retaining ring. • Inspect for damaged variable low clutch piston assembly and spring.
Front Differential Carrier	Inspect for damaged gears and bearings.
Drive Link Assembly	Inspect for damaged sprockets, bearings, and drive link.

VIBRATION

Checks	Causes
Lug bolts for the Input Drive Flange	Inspect for loose bolts.
Input Internal Gear Thrust Bearing	Inspect for wear or damage.
Output Carrier Thrust Bearing	Inspect the bearing for wear or damage.
Output Carrier	• Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers. • Inspect for a worn or damaged center support roller bearing assembly. • Inspect for damaged thrust bearings. • Inspect the carrier assembly for damaged output carrier rear sun gear thrust bearing (captured).
Front Differential Carrier	Inspect for damaged gears and bearings.

NOISE AND VIBRATION ANALYSIS

A noise or vibration that is noticeable when the vehicle is in motion MAY NOT be the result of the transmission.

If noise or vibration is noticeable in PARK and NEUTRAL with the engine at idle, but is less noticeable as RPM increases, the cause may be from poor engine performance.

- Inspect the tires for the following conditions:
 - Uneven wear
 - Imbalance
 - Mixed sizes
 - Mixed radial and bias ply
- Inspect the suspension components for the following conditions:
 - Alignment wear or damage
 - Loose fasteners
 - Driveline damage or wear
- Inspect the engine and transmission mounts for damage and loose bolts.
- Inspect the transmission case mounting holes for the following conditions:
 - Missing bolts, nuts, and studs
 - Stripped threads
 - Cracks
- Inspect the flywheel for the following conditions:
 - Missing or loose bolts
 - Cracks
 - Imbalance
- Inspect the input drive flange for the following conditions:
 - Missing or loose bolts or lugs
 - Missing or loose balance weights
 - Imbalance caused by heat distortion or fluid contamination

NO PARK OR DRIVE

Checks	Causes
Front Differential Carrier	Inspect for damaged gears and bearings.
Drive Link Assembly	Inspect for damaged sprockets, bearings, and drive link.

NO DRIVE IN ALL RANGES

Checks	Causes
Output Carrier	• Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers. • Inspect for damaged thrust bearings. • Inspect for damaged sun gears. • Inspect the carrier assembly for damaged output carrier rear sun gear thrust bearing (captured).
Drive Motor - 2nd Position	Motor Failure • Inspect connections at motor • Inspect motor end bearings
Thrust Bearing	Inspect the bearing for wear or damage.
Front Differential Carrier	Inspect for damaged gears and bearings.
Drive Link Assembly	Inspect for damaged sprockets, bearings, and drive link.
Front Differential Carrier Sun Gear	Inspect for spline wear or damage.
Automatic Transmission Fluid Filter	• Inspect for damaged or restricted fluid filter. • Inspect for damaged fluid filter seal or improper sealing interface, leaks, and fluid aeration.
Automatic Transmission Fluid Pump Outlet Seal	Inspect for worn or damaged seal.

NO REVERSE GEAR

Checks	Causes
Output Carrier	• Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers. • Inspect for damaged thrust bearings. • Inspect for damaged sun gears. • Inspect the carrier assembly for damaged output carrier rear sun gear thrust bearing (captured).
Drive Motor - 2nd Position	Motor Failure • Inspect connections at motor • Inspect motor end bearings

Checks	Causes
Thrust Bearing	Inspect the bearing for wear or damage.
Front Differential Carrier	Inspect for damaged gears and bearings.
Drive Link Assembly	Inspect for damaged sprockets, bearings, and drive link.
Front Differential Carrier Sun Gear	Inspect for spline wear or damage.
Automatic Transmission Fluid Filter	- Inspect for damaged or restricted fluid filter. - Inspect for damaged fluid filter seal or improper sealing interface, leaks, and fluid aeration.
Automatic Transmission Fluid Pump Outlet Seal	Inspect for worn or damaged seal.

NO DRIVE OR REVERSE GEAR

Checks	Causes
Variable Low Clutch Assembly	- Inspect for damaged or distorted clutch housing. - Inspect for damaged or distorted clutch plates.
Variable High Clutch Assembly	- Inspect for damaged or distorted clutch housing. - Inspect for damaged or distorted clutch plates.

HARSH, SOFT, DELAYED OR SLIPPING DRIVE OR REVERSE GEAR

Checks	Causes
Variable Low Clutch Assembly	- Inspect for damaged or worn variable low clutch plates. - Inspect for damaged variable low clutch backing plate. - Inspect for damaged variable low clutch backing plate retaining ring. - Inspect for damaged variable low clutch piston assembly and spring.
Variable High Clutch Assembly	- Inspect for damaged or worn variable high clutch plates. - Inspect for damaged variable high clutch backing plate. - Inspect for damaged variable high clutch backing plate retaining ring. - Inspect for damaged variable high clutch piston assembly and spring.
Control Valve Assembly	- Inspect solenoid module assembly for damage to plastic body, electrical connections and wire harness, or seal plate. - Inspect low variable shift valve for stickiness or stuck condition. - Inspect for stuck or sticky compensator feed valve. - Inspect for leak paths within the variable high or compensator feed hydraulic circuits.

Checks	Causes
	• Inspect for leaking or damaged control valve body spacer plate. • Inspect for plugged control valve body spacer plate orifice(s).

STUCK IN DRIVE OR REVERSE GEAR

Checks	Causes
Variable Low Clutch Assembly	• Inspect for damaged or worn variable low clutch plates. • Inspect for damaged variable low clutch backing plate. • Inspect for damaged variable low clutch backing plate retaining ring. • Inspect for damaged variable low clutch piston assembly and spring.

HARSH GARAGE SHIFT

Checks	Causes
Variable Low Clutch Assembly	Inspect for damaged or worn variable low clutch plates.

SEIZED ENGINE OR TRANSMISSION SEPARATION

Removal Procedure

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Ensure that the vehicle is properly supported and squarely positioned. Refer to [Lifting and Jacking the Vehicle](#).

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
3. Disable the high voltage system and disconnect the A4 Hybrid/EV Battery Pack high voltage harness connector at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#).

4. Set the parking brake.
5. Remove the engine and transmission assembly from the vehicle. Refer to [Engine Replacement](#) , and [Transmission Replacement](#).
6. With the engine and transmission assembly on the cradle, support both the engine and transmission.

Fig. 28: Drive Motor Power Inverter Module Cover And Water Outlet
Courtesy of GENERAL MOTORS COMPANY

7. Remove Drive Motor Power Inverter Module Cover (1). Refer to [Drive Motor Power Inverter Module Cover Removal](#)
8. Remove Water Outlet (2). Refer to [Water Outlet Replacement](#)
9. Install Drive Motor Power Inverter Module Cover (1). Refer to [Drive Motor Power Inverter Module Cover Installation](#)

Fig. 29: Hidden Torque Dampener And Differential Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Mark the location of the three hidden torque dampener and differential housing bolts 1 to 3.
11. With an air chisel, remove the torque dampener and differential housing material in order to gain access to the three hidden bolts.

12. With a 13 mm box end wrench, remove the torque dampener and differential housing bolts including the now exposed hidden bolts. (Qty: 16)

Fig. 30: Transmission Case And Torque Dampener And Differential Housing
Courtesy of GENERAL MOTORS COMPANY

13. With an appropriate hoist, separate the transmission case (1) from the torque dampener and differential housing (2).

Fig. 31: Input Internal Gear, Retaining Ring And Transmission Torque Dampener Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Remove Input Internal Gear Retaining Ring (1)
15. Remove Input Internal Gear (2)
16. Remove Automatic Transmission Torque Dampener Bolts (3) (Qty: 6)
17. Remove the torque dampener and differential housing to engine bolts.
18. Remove the torque dampener and differential housing from the engine.
19. Remove the input drive flange from the automatic transmission flex plate.

Installation Procedure

1. Determine the correct torque dampener thrust washer. Refer to [Automatic Transmission Torque Dampener Thrust Washer Measurement](#).
2. Using a NEW torque dampener and differential housing assembly, install the torque dampener and differential housing to the transmission case. Refer to [Automatic Transmission Torque Dampener and Differential Housing Installation](#).

REPAIR INSTRUCTIONS - ON VEHICLE

TRANSMISSION CONTROL LEVER KNOB REPLACEMENT

Fig. 32: Transmission Control Lever Knob

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Transmission Control Lever Knob Procedure 1. Release the lever boot from the 6 retainers (arrows). 2. Pull the knob with both hands upward with a twisting motion of max. 1 - 2 degrees to release from the transmission control lever. 3. Remove transmission control lever knob from the transmission control. NOTE: Considerable effort may be necessary to release the

Callout	Component Name
	knob from the control lever.

TRANSMISSION CONTROL REPLACEMENT (WITH BASE)

Fig. 33: Transmission Control (With Base)
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Transmission Control Lever Knob. Refer to Transmission Control Lever Knob Replacement 2. Remove Front Floor Console. Refer to Front Floor Console Replacement WARNING: After installing the transmission range selector shift cable, pull up and push down on ALL connections to verify that	

Callout	Component Name
	the connections are fully seated and properly engaged. Failure to perform this task can result in the vehicle not being able to shift into PARK causing potential vehicle damage and bodily injury. 3. Disconnect Range Selector Lever Cable @ Transmission Control. Refer to Range Selector Lever Cable Replacement 4. Disconnect the wiring harness connector and the wiring harness retainers.
1	Transmission Control Lever Housing Bracket Nut (Qty: 5) CAUTION: Refer to Fastener Caution Tighten 9 N.m (80 lb in)
2	Transmission Control Procedure 1. Transfer parts as needed. 2. After the installation is complete perform a range selector lever cable adjustment. Refer to Range Selector Lever Cable Adjustment.

TRANSMISSION CONTROL REPLACEMENT (WITHOUT BASE)

Removal Procedure

1. Set the park brake.
2. Remove Front Floor Console. Refer to [Front Floor Console Replacement](#)

Fig. 34: Range Selector Lever Cable And Transmission Control

Courtesy of GENERAL MOTORS COMPANY

3. Remove the range selector lever cable (1) from the transmission control. Release the cable from the bracket by pushing the retainer (arrow).
4. Disconnect the transmission control electrical connector.

Fig. 35: Nut And Washer

Courtesy of GENERAL MOTORS COMPANY

5. Remove the nut and washer (1) from the control assembly.

Fig. 36: Main Shaft Bolt

Courtesy of GENERAL MOTORS COMPANY

6. Remove the main shaft bolt (1).

Fig. 37: Transmission Control Assembly

Courtesy of GENERAL MOTORS COMPANY

7. Pull the transmission control assembly (1) rearward and upward to unseat it from the transmission control base.
8. Remove the transmission control assembly from the vehicle.

Installation Procedure

1. Position the transmission control assembly to the transmission control base.

Fig. 38: Transmission Control Assembly

Courtesy of GENERAL MOTORS COMPANY

2. Push the transmission control assembly (1) downward and forward to seat it to the transmission control base.

NOTE: Ensure the flats of the bolt align with the transmission control assembly flat points inside the base before tightening the nut.

Fig. 39: Main Shaft Bolt

Courtesy of GENERAL MOTORS COMPANY

3. Install the main shaft bolt (1).

Fig. 40: Nut And Washer

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

NOTE: When installing the transmission control main shaft bolt, the face of the bolt must be held in the slot of the mounting bracket as the nut is torqued to ensure it remains seated and doesn't rotate out of the slot. Failure to perform this task can result in a loose shifter feel, squeaks & rattles, or excessive cross car lash resulting in a customer's poor perceived quality of the system.

4. Install the nut and washer (1) to the control assembly and tighten to 7 N.m (62 lb in).
5. Connect the transmission control electrical connector.

Fig. 41: Range Selector Lever Cable And Transmission Control

Courtesy of GENERAL MOTORS COMPANY

WARNING: After installing the transmission range selector shift cable, pull up and push down on ALL connections to verify that the connections are fully seated and properly engaged. Failure to perform this task can result in the vehicle not being able to shift into PARK causing potential vehicle damage and bodily injury.

6. Install the range selector lever cable (1) to the transmission control.
7. Install Front Floor Console. Refer to [Front Floor Console Replacement](#)
8. Release the park brake.
9. Adjust the automatic transmission range selector lever cable. Refer to [Range Selector Lever Cable Adjustment](#)

DRIVE MOTOR GENERATOR POWER INVERTER MODULE REPLACEMENT

Removal Procedure

Fig. 42: Drive Motor Power Inverter Module Cover And Components

Courtesy of GENERAL MOTORS COMPANY

1. Remove Drive Motor Power Inverter Module Cover (2). Refer to [Drive Motor Power Inverter Module Cover Replacement](#)

Fig. 43: Drive Motor Power Inverter Module And Components
 Courtesy of GENERAL MOTORS COMPANY

2. Remove Drive Motor Power Inverter Module (3). Refer to [Drive Motor Power Inverter Module Removal](#)

Installation Procedure

Fig. 44: Drive Motor Power Inverter Module And Components

Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Power Inverter Module (3). Refer to [Drive Motor Power Inverter Module Installation](#)

Fig. 45: Drive Motor Power Inverter Module Cover And Components

Courtesy of GENERAL MOTORS COMPANY

2. Install Drive Motor Power Inverter Module Cover (2). Refer to [Drive Motor Power Inverter Module Cover Replacement](#)
3. Program the power inverter module and the immobilizer control module. Refer to [Control Module References](#)

DRIVE MOTOR POWER INVERTER MODULE COVER REPLACEMENT

Special Tools

BO-38185 Hose Clamp Pliers

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.

- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Set the parking brake.
2. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
3. Disable the high voltage system and disconnect the A4 Hybrid/EV Battery Pack high voltage harness connector at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#) .

Fig. 46: Radiator Surge Tank, Bracket And Clips
Courtesy of GENERAL MOTORS COMPANY

4. Remove Radiator Surge Tank Clip (1)

NOTE: To remove the radiator surge tank from the radiator surge tank bracket move it in driving direction.

5. Move the radiator surge tank (4) in arrow direction to release the radiator surge tank clip (2) from the radiator surge tank bracket (3).
6. Relocate the radiator surge tank out of the way of the Drive Motor Power Inverter Module Cover and secure with tie strap.

Fig. 47: Range Selector Lever Cable And Range Selector Lever Cable Lever
 Courtesy of GENERAL MOTORS COMPANY

7. Remove Range Selector Lever Cable (1) @ Range Selector Lever Cable Lever

Fig. 48: Range Selector Lever Cable And Transmission Range Selector Lever Cable Bracket
 Courtesy of GENERAL MOTORS COMPANY

8. Remove the range selector lever cable (1) from the range selector lever cable bracket.

Release the cable from the bracket by pushing the retainer (arrow).

Fig. 49: Drive Motor Battery Positive And Negative Cable Connector

Courtesy of GENERAL MOTORS COMPANY

9. Place a shop towel over the drive motor battery positive and negative cable connector (1) to prevent coolant from entering the cover.
10. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
11. Remove Front Wheelhouse Liner. Refer to [Front Wheelhouse Liner Replacement \(Left Side\) Front Wheelhouse Liner Replacement \(Right Side\)](#)
12. Drain Drive Motor Generator Power Inverter Module Cooling System. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)

Fig. 50: Coolant Hose And Clamp

Courtesy of GENERAL MOTORS COMPANY

NOTE: The following 2 steps are necessary to prevent contamination of other components while removing residual coolant with shop air.

13. Loosen Clamp (2)
14. Disconnect Drive Motor Generator Control Module Cooling Outlet Hose (1)

15. Lower the vehicle.

Fig. 51: Drive Motor Generator Power Inverter Module Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

16. Loosen the drive motor generator power inverter module outlet hose clamp (2), using the **BO-38185** pliers.
17. Remove the drive motor generator power inverter module outlet hose (1).
18. Using shop air, blow air through the drive motor power inverter module cooling outlet hose to remove residual coolant from the drive motor power inverter module.

Fig. 52: Drive Motor Battery Positive And Negative Cable Connector And Bolts
Courtesy of GENERAL MOTORS COMPANY

19. Remove Drive Motor Battery Positive and Negative Cable Connector Bolts (1) (Qty: 4)
20. Remove Drive Motor Battery Positive and Negative Cable Connector (2)

Fig. 53: Engine Wiring Harness Bracket Nut And Stud
 Courtesy of GENERAL MOTORS COMPANY

21. Remove Engine Wiring Harness Bracket Nut (1)
22. Remove the engine wiring harness stud (2).

Fig. 54: Drive Motor Power Inverter Module Cover And Components
 Courtesy of GENERAL MOTORS COMPANY

23. Remove Drive Motor Power Inverter Module Cover (2). Refer to [Drive Motor Power Inverter Module Cover Removal](#)

Installation Procedure

Fig. 55: Drive Motor Power Inverter Module Cover And Components
 Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Power Inverter Module Cover (2). Refer to [Drive Motor Power Inverter Module Cover Installation](#)

Fig. 56: Engine Wiring Harness Bracket Nut And Stud
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

2. Install the engine wiring harness stud (2) and tighten to 9 N.m (80 lb in).
3. Install and tighten Engine Wiring Harness Bracket Nut (1) to 9 N.m (80 lb in)

Fig. 57: Drive Motor Battery Positive And Negative Cable Connector And Bolts (With Bolt Tightening Sequence)

Courtesy of GENERAL MOTORS COMPANY

4. Install Drive Motor Battery Positive and Negative Cable Connector (2)
5. Tighten Drive Motor Battery Positive and Negative Cable Connector Bolts (1) (Qty: 4) in sequence to 9 N.m (80 lb in)

Fig. 58: Drive Motor Generator Power Inverter Module Outlet Hose And Clamp

Courtesy of GENERAL MOTORS COMPANY

6. Install the drive motor generator power inverter module outlet hose (1).
7. Install the drive motor generator power inverter module outlet hose clamp (2), using the **BO-38185** pliers.

Fig. 59: Range Selector Lever Cable And Transmission Range Selector Lever Cable Bracket
Courtesy of GENERAL MOTORS COMPANY

8. Install the range selector lever cable (1) to the range selector lever cable bracket.

The retainer snaps automatically in.

Fig. 60: Range Selector Lever Cable And Range Selector Lever Cable Lever
Courtesy of GENERAL MOTORS COMPANY

9. Install Range Selector Lever Cable (1) @ Range Selector Lever Cable Lever
10. Adjust Range Selector Lever Cable. Refer to [Range Selector Lever Cable Adjustment](#)

Fig. 61: Radiator Surge Tank, Bracket And Clips

Courtesy of GENERAL MOTORS COMPANY

11. Remove the tie strap holding the radiator surge tank.

NOTE: To install the radiator surge tank to the radiator surge tank bracket move it against driving direction.

12. Move the radiator surge tank (4) in arrow direction to clip in the radiator surge tank clip (2) into the radiator surge tank bracket (3).

13. Install Radiator Surge Tank Clip (1)

14. Raise the vehicle.

Fig. 62: Coolant Hose And Clamp

Courtesy of GENERAL MOTORS COMPANY

15. Connect Drive Motor Generator Control Module Cooling Outlet Hose (1)

16. Install Clamp (2)

17. Install Front Wheelhouse Liner. Refer to [Front Wheelhouse Liner Replacement \(Left Side\)](#) [Front Wheelhouse Liner Replacement \(Right Side\)](#)

18. Fill Drive Motor Generator Power Inverter Module Cooling System. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)
19. Lower the vehicle.
20. Enable the high voltage system and connect the A4 Hybrid/EV Battery Pack high voltage harness connector at the T6 Power Inverter Module. Refer to [High Voltage Enabling](#) .
21. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#)

AUTOMATIC TRANSMISSION RANGE SELECTOR LEVER REPLACEMENT

Fig. 63: Automatic Transmission Range Selector Lever
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Set the parking brake. WARNING: After installing the transmission range selector shift cable, pull up and push down on ALL connections	

Callout	Component Name
	to verify that the connections are fully seated and properly engaged. Failure to perform this task can result in the vehicle not being able to shift into PARK causing potential vehicle damage and bodily injury. 2. Remove Range Selector Lever Cable @ Automatic Transmission Range Selector Lever. Refer to Range Selector Lever Cable Replacement
1	Transmission Range Selector Lever Nut WARNING: Hold the transmission range selector lever while removing or installing the lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to

Callout	Component Name
	roll when placed in the park position. CAUTION: Refer to Fastener Caution Tighten 30 N.m (22 lb ft)
2	Automatic Transmission Range Selector Lever Procedure After the installation is complete perform a range selector lever cable adjustment. Refer to Range Selector Lever Cable Adjustment.

RANGE SELECTOR LEVER CABLE REPLACEMENT

Removal Procedure

1. Set the parking brake.

Fig. 64: Range Selector Lever Cable And Range Selector Lever Cable Lever
Courtesy of GENERAL MOTORS COMPANY

2. Remove Range Selector Lever Cable (1) @ Range Selector Lever Cable Lever

Fig. 65: Range Selector Lever Cable And Transmission Range Selector Lever Cable Bracket
Courtesy of GENERAL MOTORS COMPANY

3. Remove the range selector lever cable (1) from the range selector lever cable bracket.

Release the cable from the bracket by pushing the retainer (arrow).

4. Remove Front Floor Console. Refer to [**Front Floor Console Replacement**](#)

Fig. 66: Range Selector Lever Cable And Transmission Control
Courtesy of GENERAL MOTORS COMPANY

5. Remove the range selector lever cable (1) from the transmission control.

Release the cable from the bracket by pushing the retainer (arrow).

6. Note the routing of the range selector lever cable.

Fig. 67: Range Selector Lever Cable And Grommet
 Courtesy of GENERAL MOTORS COMPANY

7. Gently pry the grommet out, then remove the range selector lever cable (1) from the inside of the vehicle.

Installation Procedure

Fig. 68: Range Selector Lever Cable And Grommet
 Courtesy of GENERAL MOTORS COMPANY

1. Position the range selector lever cable in the vehicle.
2. Install the range selector lever cable grommet (1) into the panel.

Fig. 69: Range Selector Lever Cable And Transmission Control
Courtesy of GENERAL MOTORS COMPANY

3. Install the range selector lever cable (1) to the transmission control.

The retainer snaps automatically in.

4. Install Front Floor Console. Refer to [Front Floor Console Replacement](#)

Fig. 70: Range Selector Lever Cable And Transmission Range Selector Lever Cable Bracket
Courtesy of GENERAL MOTORS COMPANY

5. Install the range selector lever cable (1) to the range selector lever cable bracket.

The retainer snaps in automatically.

Fig. 71: Range Selector Lever Cable And Range Selector Lever Cable Lever
 Courtesy of GENERAL MOTORS COMPANY

WARNING: After installing the transmission range selector shift cable, pull up and push down on ALL connections to verify that the connections are fully seated and properly engaged. Failure to perform this task can result in the vehicle not being able to shift into PARK causing potential vehicle damage and bodily injury.

6. Install Range Selector Lever Cable (1) @ Range Selector Lever Cable Lever
7. Adjust Range Selector Lever Cable. Refer to [Range Selector Lever Cable Adjustment](#)

RANGE SELECTOR LEVER CABLE ADJUSTMENT

1. Set the parking brake.

Fig. 72: Retaining Collar And Range Select Cable Adjuster Clip
 Courtesy of GENERAL MOTORS COMPANY

2. Pull the retaining collar (1) forward, then release the range select cable adjuster clip (2) by pushing out on the adjuster clip from the underneath.

Fig. 73: Range Selector Lever

Courtesy of GENERAL MOTORS COMPANY

NOTE: Adjust the automatic transmission range selector lever cable while the transmission and the transmission control are in the Park position only. Failure to do so may cause false adjustment.

3. Verify the range selector lever (1) is in the park position.

Rotate the lever counterclockwise till the stop (arrow).

Fig. 74: Transmission Control Lever

Courtesy of GENERAL MOTORS COMPANY

NOTE: Adjust the automatic transmission range selector lever cable while the transmission and the transmission control are in the park position only. Failure to do so may cause false adjustment.

4. Verify the transmission control lever (1) is in the park position.

Fig. 75: Retaining Collar And Adjuster Clip

Courtesy of GENERAL MOTORS COMPANY

5. Depress the adjuster clip (2) locking the adjuster clip completely, then release the retaining collar (1).

WARNING: After installing the transmission range selector shift cable, pull up and push down on ALL connections to verify that the connections are fully seated and properly engaged. Failure to perform this task can result in the vehicle not being able to shift into PARK causing potential vehicle damage and bodily injury.

6. Ensure that the cable adjuster is secured.
7. Check the transmission control lever in all gear selections for proper operation.

RANGE SELECTOR LEVER CABLE BRACKET REPLACEMENT

Fig. 76: Range Selector Lever Cable Bracket
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Transmission Range Selector Lever Cable @ Automatic Transmission Range Selector Lever & Transmission Range Selector Lever Cable Bracket. Refer to Range Selector Lever Cable Replacement	
1	Transmission Range Selector Lever Cable Bracket Bolt (Qty: 2) CAUTION: Refer to Fastener Caution Tighten 30 N.m (22 lb ft)
2	Transmission Range Selector Lever Cable Bracket Procedure After the installation is complete perform a range selector lever cable adjustment. Refer to Range Selector Lever Cable Adjustment .

TRANSMISSION FLUID DRAIN AND FILL

Fig. 77: Transmission Fluid Drain and Fill
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Compartment Splash Shield. Refer to Front Compartment Splash Shield Replacement	
1	Transmission Fluid Drain Plug CAUTION: Refer to Fastener Caution Tighten 11 N.m (97 lb in)
2	Transmission Fluid Filler Cap NOTE: • Transmission will require approximately 6.5 - 7 liters (7 - 7.4 quarts) of fluid. • Fill the transmission to the proper

Callout	Component Name
	level with NEW transmission fluid. Refer to: Transmission Fluid Level and Condition Check

AUTOMATIC TRANSMISSION FLUID PRESSURE TEST HOLE PLUG REPLACEMENT

Fig. 78: Automatic Transmission Fluid Pressure Test Hole Plug
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Water Outlet. Refer to Water Outlet Replacement 2. Remove Front Underbody Air Deflector. Refer to Front Underbody Air Deflector Replacement 3. Remove Front Wheelhouse Liner (Left Side). Refer to Front Wheelhouse Liner Replacement (Left Side)	
1	Automatic Transmission Fluid Pressure Test Hole Plug (Qty: 3) CAUTION:

Callout	Component Name
	Refer to Fastener Caution Tighten 11 N.m (97 lb in)

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - LEFT SIDE

Fig. 79: Front Wheel Drive Shaft Seal - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Wheel Drive Shaft - Left Side. Refer to Front Wheel Drive Shaft Replacement	
1	Front Wheel Drive Shaft Seal Procedure Push the steering knuckle aside. NOTE: • For pushing the steering knuckle aside a 2nd

Callout	Component Name
	technician is required. • For seal removal use GE-6125-1B Slide Hammer with Adapter. with GE-23129 Universal Seal Remover. • For seal installation use GE-8092 Driver Handle with DT-50301 Seal Installer. Special Tools • DT-50301 Seal Installer • GE-6125-1B Slide Hammer with Adapter • GE-8092 Driver Handle • GE-23129 Universal Seal Remover Equivalent regional tools: Special Tools

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - RIGHT SIDE

Fig. 80: Front Wheel Drive Shaft Seal - Right Side

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Front Compartment Air Deflector. Refer to Front Compartment Air Deflector Replacement 2. Remove Front Wheel Drive Shaft - Right Side. Refer to Front Wheel Drive Shaft Replacement	
1	Front Wheel Drive Shaft Seal NOTE: • For seal removal use GE-6125-1B Slide Hammer with Adapter. with GE-23129 Universal Seal Remover. • For seal installation use

Callout	Component Name
	GE-8092 Driver Handle with DT-50301 Seal Installer. Special Tools • DT-50301 Seal Installer • GE-6125-1B Slide Hammer with Adapter • GE-8092 Driver Handle • GE-23129 Universal Seal Remover Equivalent regional tools: Special Tools

MANUAL SHIFT SHAFT SEAL REPLACEMENT

Removal Procedure

1. Set the parking brake.
2. Remove Automatic Transmission Range Selector Lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#)
3. Remove Manual Shift Shaft Seal

Installation Procedure

1. Install Manual Shift Shaft Seal
2. Install Automatic Transmission Range Selector Lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#)

MANUAL SHIFT SHAFT AND SEAL REPLACEMENT

Special Tools

- **DT-45201** Seal Remover
- **DT-51672** Seal Installer

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Set the parking brake.
2. Remove Automatic Transmission Range Selector Lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#)
3. Remove Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#)

Fig. 81: Manual Shift Detent Lever Pin And Shaft

Courtesy of GENERAL MOTORS COMPANY

4. Remove Manual Shift Detent Lever Pin (7). Refer to [Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Removal](#)
5. Remove Manual Shift Detent Lever Shaft (9). Refer to [Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Removal](#)

Fig. 82: Manual Shift Shaft Seal And Removal Tools

Courtesy of GENERAL MOTORS COMPANY

6. Install the **DT-45201** remover intermediate part (2) to the manual shift shaft seal (3)
7. Install the **DT-45201** remover inner part (1) to the intermediate part and tighten carefully.

Fig. 83: Removal Tool Outer Part

Courtesy of GENERAL MOTORS COMPANY

8. Install the **DT-45201** remover outer part (1) to the **DT-45201** remover and tighten carefully in order to pull out the manual shift shaft seal.

Fig. 84: Manual Shift Shaft Seal And Removal Tool Outer Part

Courtesy of GENERAL MOTORS COMPANY

9. Remove the **DT-45201** remover (1) along with the manual shift shaft seal (2).
10. Remove Manual Shift Shaft Seal @ **DT-45201** remover.

Installation Procedure

Fig. 85: Manual Shift Shaft Seal

Courtesy of GENERAL MOTORS COMPANY

1. Install Manual Shift Shaft Seal (1) using **DT-51672** installer

Fig. 86: Manual Shift Detent Lever Shaft And Pin

Courtesy of GENERAL MOTORS COMPANY

2. Install Manual Shift Detent Lever Shaft (3). Refer to [Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Installation](#)
3. Install Manual Shift Detent Lever Pin (5). Refer to [Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Installation](#)
4. Install Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#)
5. Install Automatic Transmission Range Selector Lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#)

MANUAL SHIFT DETENT LEVER SHAFT REPLACEMENT

Removal Procedure

1. Set the parking brake.

3. Install Automatic Transmission Range Selector Lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#)
4. Install Range Selector Lever Cable @ Automatic Transmission Range Selector Lever. Refer to [Range Selector Lever Cable Replacement](#)
5. Adjust Range Selector Lever Cable. Refer to [Range Selector Lever Cable Adjustment](#) - Adjust

MANUAL SHIFT SHAFT AND MANUAL SHIFT DETENT LEVER REPLACEMENT

Removal Procedure

1. Set the parking brake.
2. Remove Range Selector Lever Cable @ Automatic Transmission Range Selector Lever. Refer to [Range Selector Lever Cable Replacement](#)
3. Remove Automatic Transmission Range Selector Lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#)
4. Remove Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#)

Fig. 89: Manual Shift Detent Lever Pin And Shaft

Courtesy of GENERAL MOTORS COMPANY

5. Remove the manual shift detent lever pin (7) and the manual shift detent lever shaft (9). Refer to [Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Removal](#).

Fig. 90: Manual Shift Detent Lever, Spring And Manual Shift Shaft Pin
Courtesy of GENERAL MOTORS COMPANY

6. Remove Manual Shift Detent Lever Spring (1)
7. Remove Manual Shift Shaft Pin (2)
8. Remove Manual Shift Detent Lever (3)

Installation Procedure

Fig. 91: Manual Shift Detent Lever, Spring And Manual Shift Shaft Pin
Courtesy of GENERAL MOTORS COMPANY

1. Install Manual Shift Detent Lever (3)
2. Install Manual Shift Shaft Pin (2)
3. Install and tighten Manual Shift Detent Lever Spring (1) to 12 N.m (106 lb in)

Fig. 92: Manual Shift Detent Lever Pin And Shaft

Courtesy of GENERAL MOTORS COMPANY

4. Install the manual shift detent lever pin (7) and the manual shift detent lever shaft (9). Refer to [Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Installation](#).
5. Install Manual Shift Detent Lever Pin
6. Install Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#)
7. Install Automatic Transmission Range Selector Lever. Refer to [Automatic Transmission Range Selector Lever Replacement](#)
8. Install Range Selector Lever Cable @ Automatic Transmission Range Selector Lever. Refer to [Range Selector Lever Cable Replacement](#)
9. Adjust Range Selector Lever Cable. Refer to [Range Selector Lever Cable Adjustment](#)

CONTROL VALVE BODY COVER REPLACEMENT

Special Tools

BO-38185 Hose Clamp Pliers

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Drain Engine Cooling System. Refer to [Cooling System Draining and Filling](#)
2. Remove Radiator Inlet Hose. Refer to [Radiator Inlet Hose Replacement](#)
3. Remove Radiator Surge Tank (Drive Motor Battery Radiator Surge Tank). Refer to [Radiator Surge Tank Replacement \(Drive Motor Battery Radiator Surge Tank\)](#)
4. Remove Radiator Surge Tank (Drive Motor Generator Power Inverter Module Surge Tank). Refer to [Radiator Surge Tank Replacement \(Drive Motor Generator Power Inverter Module Surge Tank\)](#)

Fig. 93: Radiator Inlet Hose, Hose Clamps And Retainer
 Courtesy of GENERAL MOTORS COMPANY

5. Loosen Radiator Inlet Hose Clamps (1) (Qty: 3) using **BO-38185** pliers
6. Disconnect Retainer (3)
7. Remove Radiator Inlet Hose (2)

Fig. 94: Radiator Inlet Hoses And Retainer
 Courtesy of GENERAL MOTORS COMPANY

8. Disconnect Retainer (2)
9. Position the 2 radiator inlet hoses (1) aside to gain access.

Fig. 95: Heater Water Shutoff Valve Inlet Hose And Bolt

Courtesy of GENERAL MOTORS COMPANY

10. Remove Heater Water Shutoff Valve Inlet Hose Bolt (1)
11. Position the heater water shutoff inlet hose (2) aside to gain access.
12. Drain the transmission fluid. Refer to [Transmission Fluid Drain and Fill](#)
13. Remove the front wheelhouse liner - left side. Refer to [Front Wheelhouse Liner Replacement \(Left Side\)](#)

Fig. 96: Transmission Fluid Cooler Inlet And Outlet Pipe Clip

Courtesy of GENERAL MOTORS COMPANY

14. Remove Transmission Fluid Cooler Inlet and Outlet Pipe Clip (1)

Fig. 97: Transmission Fluid Cooler Inlet Pipe, Bolt And Sealing Washer
Courtesy of GENERAL MOTORS COMPANY

15. Remove Transmission Fluid Cooler Pipe Bolt (1)
16. Disconnect Transmission Fluid Cooler Inlet Pipe (3)
17. Remove and DISCARD Sealing Washer (2)
18. Position the transmission fluid cooler inlet pipe aside to gain access to the control valve body cover bolts.

Fig. 98: Control Valve Body Cover, Bolts And Gasket
Courtesy of GENERAL MOTORS COMPANY

19. Place a container beneath the control valve body cover (2) to catch spilling transmission fluid.
20. Remove Control Valve Body Cover Bolts (3) (Qty: 16)
21. Remove Control Valve Body Cover (2)

NOTE: The gasket is reusable, inspect the gasket and replace if damaged.

22. Remove Control Valve Body Cover Gasket (1)

Installation Procedure

Fig. 99: Control Valve Body Cover, Bolts And Gasket

Courtesy of GENERAL MOTORS COMPANY

NOTE: The gasket is reusable, inspect the gasket and replace if damaged.

1. Install Control Valve Body Cover Gasket (1)
2. Install Control Valve Body Cover (2)

CAUTION: Refer to [Fastener Caution](#)

3. Install Control Valve Body Cover Bolts (3) (Qty: 16) and Hand tighten only.

Fig. 100: Control Valve Body Cover Bolts Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

4. Tighten Control Valve Body Cover Bolts in sequence (Qty: 16) to 9 N.m (80 lb in)

Fig. 101: Transmission Fluid Cooler Inlet Pipe, Bolt And Sealing Washer
Courtesy of GENERAL MOTORS COMPANY

5. Reposition Transmission Fluid Cooler Inlet Pipe (3)
6. Install a NEW sealing washer (2).
7. Connect Transmission Fluid Cooler Inlet Pipe (3)
8. Install and tighten Transmission Fluid Cooler Pipe Bolt (1) to 22 N.m (16 lb ft)

Fig. 102: Transmission Fluid Cooler Inlet And Outlet Pipe Clip
Courtesy of GENERAL MOTORS COMPANY

9. Install Transmission Fluid Cooler Inlet and Outlet Pipe Clip (1)
10. Install the front wheelhouse liner - left side. Refer to [Front Wheelhouse Liner Replacement \(Left Side\)](#)

Fig. 103: Heater Water Shutoff Valve Inlet Hose And Bolt

Courtesy of GENERAL MOTORS COMPANY

11. Position the heater water shutoff inlet hose (2) into original position.
12. Install and tighten Heater Water Shutoff Valve Inlet Hose Bolt (1) to 22 N.m (16 lb ft)

Fig. 104: Radiator Inlet Hoses And Retainer

Courtesy of GENERAL MOTORS COMPANY

13. Position the 2 radiator inlet hoses (1) into original position.
14. Connect Retainer (2)

Fig. 105: Radiator Inlet Hose, Hose Clamps And Retainer
Courtesy of GENERAL MOTORS COMPANY

15. Install Radiator Inlet Hose (2)
16. Connect Retainer (3)
17. Tighten Radiator Inlet Hose Clamps (1) (Qty: 3) using **BO-38185** pliers
18. Install Radiator Surge Tank (Drive Motor Generator Power Inverter Module Surge Tank). Refer to [Radiator Surge Tank Replacement \(Drive Motor Generator Power Inverter Module Surge Tank\)](#)
19. Install Radiator Surge Tank (Drive Motor Battery Radiator Surge Tank). Refer to [Radiator Surge Tank Replacement \(Drive Motor Battery Radiator Surge Tank\)](#)
20. Install Radiator Inlet Hose. Refer to [Radiator Inlet Hose Replacement](#)
21. Fill Engine Cooling System. Refer to [Cooling System Draining and Filling](#)
22. Fill the transmission to the proper level with NEW transmission fluid. Refer to [Transmission Fluid Level and Condition Check](#)

CONTROL VALVE BODY REPLACEMENT

Special Tools

BO-38185 Hose Clamp Pliers

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#)

Fig. 106: Control Valve Body Bolts, Control Solenoid Valve And Filter Plate
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the control solenoid valve wiring harness.
3. Remove Control Valve Body Bolts (1) (Qty: 4)
4. Remove Control Solenoid Valve (2)
5. Remove Control Solenoid Valve Filter Plate (3)

Fig. 107: Control Valve Body Components
Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the control valve body wiring harness.
7. Remove Fluid Transfer Pipe Bolt (1)
8. Remove Fluid Transfer Pipe (2)
9. Remove Control Valve Body Bolts (3) (Qty: 13)
10. Remove Control Valve Body (4)
11. Remove Control Valve Body Spacer Plate Retainer (5) (Qty: 2)
12. Remove and DISCARD Control Valve Lower Body Spacer Plate (6)

13. Remove and DISCARD Variable Low Clutch Fluid Passage Seal (7)

Installation Procedure

Fig. 108: Control Valve Body Components

Courtesy of GENERAL MOTORS COMPANY

NOTE: Install a **NEW** seal.

1. Install NEW Variable Low Clutch Fluid Passage Seal (7)

NOTE: Install a **NEW** spacer plate.

2. Install NEW Control Valve Lower Body Spacer Plate (6)
3. Install Control Valve Body Spacer Plate Retainer (5) (Qty: 2)
4. Install Control Valve Body (4)

CAUTION: Refer to **Fastener Caution**

5. Install and hand tighten Control Valve Body Bolts (3) (Qty: 13). Hand tighten only.
6. Install Fluid Transfer Pipe (2)
7. Install and hand tighten Fluid Transfer Pipe Bolt (1). Hand tighten only.
8. Connect the control valve body wiring harness.

Fig. 109: Control Valve Body Bolt And Fluid Transfer Pipe Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

9. Tighten Control Valve Body Bolts @ Fluid Transfer Pipe Bolt in sequence to 9 N.m (80 lb in)

Fig. 110: Control Valve Body Bolts, Control Solenoid Valve And Filter Plate
Courtesy of GENERAL MOTORS COMPANY

10. Install Control Solenoid Valve Filter Plate (3)
11. Install Control Solenoid Valve (2)
12. Install and hand tighten Control Valve Body Bolts (1) (Qty: 4). Hand tighten only.
13. Connect the control solenoid valve wiring harness.

Fig. 111: Control Valve Body Bolts Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

14. Tighten Control Valve Body Bolts in sequence to 9 N.m (80 lb in)
15. Install Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#)

LINE PRESSURE CONTROL SOLENOID VALVE REPLACEMENT

Special Tools

BO-38185 Hose Clamp Pliers

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Control Valve Body. Refer to [Control Valve Body Replacement](#)

Fig. 112: Line Pressure Control Solenoid Valve And Retainer
Courtesy of GENERAL MOTORS COMPANY

2. Remove Line Pressure Control Solenoid Valve Retainer (2)
3. Remove Line Pressure Control Solenoid Valve (1)

Installation Procedure

Fig. 113: Line Pressure Control Solenoid Valve And Retainer

Courtesy of **GENERAL MOTORS COMPANY**

1. Install Line Pressure Control Solenoid Valve (1)
2. Install Line Pressure Control Solenoid Valve Retainer (2)
3. Install Control Valve Body. Refer to [Control Valve Body Replacement](#)

CONTROL SOLENOID VALVE REPLACEMENT

Special Tools

BO-38185 Hose Clamp Pliers

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Control Valve Body. Refer to [Control Valve Body Cover Replacement](#)

Fig. 114: Control Valve Body Bolts, Control Solenoid Valve And Filter Plate
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Control Solenoid Valve Wiring Harness
3. Remove Control Valve Body Bolts (1) (Qty: 4)
4. Remove Control Solenoid Valve (2)
5. Remove Control Solenoid Valve Filter Plate (3)

Installation Procedure

Fig. 115: Control Valve Body Bolts, Control Solenoid Valve And Filter Plate
Courtesy of GENERAL MOTORS COMPANY

1. Install Control Solenoid Valve Filter Plate (3)
2. Install Control Solenoid Valve (2)

CAUTION: Refer to **Fastener Caution**

3. Install and hand tighten Control Valve Body Bolts (1) (Qty: 4). Hand tighten only.
4. Connect Control Solenoid Valve Wiring Harness

Fig. 116: Control Valve Body Bolts Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

5. Tighten Control Valve Body Bolts in sequence to 9 N.m (80 lb in)
6. Install Control Valve Body Cover. Refer to [Control Valve Body Cover Replacement](#)

AUTOMATIC TRANSMISSION WIRING HARNESS REPLACEMENT

Special Tools

BO-38185 Hose Clamp Pliers

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Disconnect Battery Negative Cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
2. Remove Control Valve Body. Refer to [Control Valve Body Replacement](#)

Fig. 117: Automatic Transmission Wiring Harness And Seals

Courtesy of GENERAL MOTORS COMPANY

NOTE: Remove the manual shift detent lever spring to aid in removal of the transmission wiring harness.

3. Remove Automatic Transmission Wiring Harness - Control Solenoid Valve (1)
4. Remove Automatic Transmission Wiring Connector Seal (2)
5. Remove Automatic Transmission Wiring Harness - Shift Shaft Position Switch (3)
6. Remove Automatic Transmission Wiring Connector Seal (4)

Installation Procedure

Fig. 118: Automatic Transmission Wiring Harness And Seals

Courtesy of GENERAL MOTORS COMPANY

1. Install Automatic Transmission Wiring Connector Seal (4)
2. Install Automatic Transmission Wiring Harness - Shift Shaft Position Switch (3)
3. Install Automatic Transmission Wiring Connector Seal (2)

NOTE: Install the manual shift detent lever spring previously removed to aid the removal of the transmission wiring harness.

4. Install Automatic Transmission Wiring Harness - Control Solenoid Valve (1)
5. Install Control Valve Body. Refer to [Control Valve Body Replacement](#)
6. Connect Battery Negative Cable. Refer to [Battery Negative Cable Disconnection and Connection](#)

TRANSMISSION MOUNT STRUT BRACKET REPLACEMENT

Fig. 119: Transmission Mount Strut Bracket
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Using a suitable jack stand, support the rear of the powertrain.	
1	Transmission Mount Strut Bolt CAUTION: Refer to Fastener Caution CAUTION: Refer to Torque-to-Yield Fastener Caution Procedure Always use NEW bolts. - Do NOT reuse old bolts. Tighten • First Pass: 100 N.m (74 lb ft) • Final Pass: 60 - 75 degrees

Callout	Component Name
	Special Tools EN-45059 Angle Meter Equivalent regional tools: Special Tools
2	Transmission Mount Strut Bracket Bolt (Qty: 3) CAUTION: Refer to Torque-to-Yield Fastener Caution Procedure Always use NEW bolts. - Do NOT reuse old bolts. Tighten • First Pass: 75 N.m (55 lb ft) • Final Pass: 45 - 60 degrees Special Tools EN-45059 Angle Meter Equivalent regional tools: Special Tools
3	Transmission Mount Strut Bracket

TRANSMISSION MOUNT TRANSMISSION-SIDE BRACKET REPLACEMENT

Fig. 120: Transmission Mount Transmission-Side Bracket

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove Transmission Mount. Refer to Transmission Mount Replacement	
1	Transmission Mount Transmission Side Bracket Bolt (Qty: 3) CAUTION: Refer to Fastener Caution CAUTION: Refer to Torque-to-Yield Fastener Caution Procedure Always use NEW bolts. - Do NOT reuse old bolts. Tighten • First Pass: 58 N.m (43 lb ft) • Final Pass: 60 - 75 degrees

TRANSMISSION MOUNT REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Engine Wiring Harness Junction Block. Refer to [Engine Wiring Harness Junction Block Replacement](#)

Fig. 121: Wiring Harness Connectors

Courtesy of GENERAL MOTORS COMPANY

2. Remove Wiring Harness Connectors (1) (Qty: 3)

Unclip (Qty: 6)

Fig. 122: Wiring Harness Retainers

Courtesy of GENERAL MOTORS COMPANY

3. Remove Wiring Harness Retainers (1) (Qty: 2)

Fig. 123: Wiring Harness Connector And Retainers

Courtesy of GENERAL MOTORS COMPANY

4. Remove Wiring Harness Connector (2) @ Retainers (1)
5. Unclip Wiring Harness Retainer (3)

Fig. 124: Engine Wiring Harness Fuse Block Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove Engine Wiring Harness Fuse Block Bracket Bolt (1)
7. Remove Engine Wiring Harness Fuse Block Bracket (2)

Fig. 125: Engine Lifting Chain And Engine Lift Rear Bracket
Courtesy of GENERAL MOTORS COMPANY

8. Install the engine lifter (1) to the engine lift rear bracket (2).
9. Apply tension to the chain.

Fig. 126: Transmission Mount And Bolts

Courtesy of GENERAL MOTORS COMPANY

10. Prior to removing the mount, mark the mount location using paint pent or a marker for correct positioning during installation.
11. Remove and DISCARD Transmission Mount Bolts (2) (Qty: 3)
12. Remove Transmission Mount Transmission Side Bolt (4)
13. Remove and DISCARD Transmission Mount Bolt (1) (Qty: 3)
14. Remove Transmission Mount (3)

Installation Procedure

Fig. 127: Transmission Mount And Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Install Transmission Mount (3)

CAUTION: Refer to [Fastener Caution](#)

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

NOTE: Install **NEW** bolts.

2. Install NEW Transmission Mount Bolts (1) (Qty: 3). Hand tighten only.

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

NOTE: Install **NEW** bolts.

3. Install NEW Transmission Mount Bolts (2) (Qty: 3). Hand tighten only.
4. Align the transmission mount and the powertrain unit to the previously made marks.
5. Tighten Transmission Mount Bolts (1) (Qty: 3)
 1. First Pass: 100 N.m (74 lb ft)
 2. Final Pass: 60 - 75 degrees, use the **EN-45059** meter
6. Tighten Transmission Mount Bolts (2) (Qty: 3)
 1. First Pass: 100 N.m (74 lb ft)
 2. Final Pass: 60 - 75 degrees, use the **EN-45059** meter
7. Install and tighten Transmission Mount Transmission Side Bolt (4) to 58 N.m (43 lb ft)

Fig. 128: Engine Lifting Chain And Engine Lift Rear Bracket
Courtesy of GENERAL MOTORS COMPANY

8. Remove the engine lifter (1) from the engine lift rear bracket (2).

Fig. 129: Engine Wiring Harness Fuse Block Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Install Engine Wiring Harness Fuse Block Bracket (2)
10. Install and tighten Engine Wiring Harness Fuse Block Bracket Bolt (1) to 22 N.m (16 lb ft).

Fig. 130: Wiring Harness Connector And Retainers
Courtesy of GENERAL MOTORS COMPANY

11. Install Wiring Harness Retainer (3)
12. Install Wiring Harness Connector (2) @ Retainer (1)

Fig. 131: Wiring Harness Retainers

Courtesy of GENERAL MOTORS COMPANY

13. Install Wiring Harness Retainers (1) (Qty: 2)

Fig. 132: Wiring Harness Connectors

Courtesy of GENERAL MOTORS COMPANY

14. Install Wiring Harness Connectors (1) (Qty: 3)

Install (Qty: 6)

15. Install Engine Wiring Harness Junction Block. Refer to [Engine Wiring Harness Junction Block Replacement](#)

TRANSMISSION REAR MOUNT REPLACEMENT

Special Tools

CH-51999 Volt Cradle Bushing Remover/Installer

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove the drivetrain and front suspension cradle from the vehicle. Refer to [Drivetrain and Front Suspension Cradle Replacement](#)

Fig. 133: Volt Cradle Bushing Remover/Installer Components

Courtesy of GENERAL MOTORS COMPANY

2. Assemble the **CH-51999** Volt Cradle Bushing Remover/Installer (1 through 8) onto the transmission rear mount and the drivetrain and front suspension cradle.
3. Turning the nut (8), release the transmission rear mount from the drivetrain and front suspension cradle.

Fig. 134: Transmission Rear Mount, Drivetrain And Front Suspension Cradle

Courtesy of GENERAL MOTORS COMPANY

4. Remove the transmission rear mount (1) from the drivetrain and front suspension cradle (2).

Installation Procedure

Fig. 135: Cradle Bushing Remover/Installer Receiver Cup, Transmission Mount And Alignment Mark
Courtesy of GENERAL MOTORS COMPANY

1. Clean the **CH-51999** Volt Cradle Bushing Remover/Installer receiver cup (3) free from oil and grease.
2. Position the transmission mount (2) into the receiver cup with the arrow on the transmission mount aligning with the alignment mark (5).

Fig. 136: Upper Tool Rim With Top Of Receiver Cup
Courtesy of GENERAL MOTORS COMPANY

NOTE: The transmission mount will be at the correct depth in the receiver cup, when the upper tool rim (a) is in the contact with the top of the receiver cup (b).

IMPORTANT: No lubricant is allowed.

3. Using a press or the threaded rod assembly, and the components (1, 4) shown from the **CH-51999** Volt Cradle Bushing Remover/Installer kit. Compress the transmission mount (2) into the receiver cup (3).
4. Clean the hole for the transmission rear mount in the drivetrain and front suspension frame cradle.

Fig. 137: Cradle Bushing Remover/Installer Components

Courtesy of GENERAL MOTORS COMPANY

NOTE: Insure the transmission mount inside the receiver cup (6) is in the correct orientation before proceeding.

5. Assemble the **CH-51999** Volt Cradle Bushing Remover/Installer (1 through 9) onto the drivetrain and front suspension cradle.

NOTE: When the rim on the tool (5) contacts the top edge of tool (6) completely, the transmission mount will be at it's correct depth in the drivetrain and front suspension cradle.

6. Turning the nut (1), install the transmission rear mount to the drivetrain and front suspension cradle.
7. Remove the **CH-51999** Volt Cradle Bushing Remover/Installer (1 through 9) from the drivetrain and front suspension cradle.
8. If the transmission rear mount is not positioned correctly, remove the transmission rear mount from the drivetrain and front suspension frame cradle and reinstall it.
9. Install the drivetrain and front suspension cradle to the vehicle. Refer to [Drivetrain and Front Suspension Cradle Replacement](#)

TRANSMISSION MOUNT STRUT REPLACEMENT

Fig. 138: Transmission Mount Strut

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Using a suitable jack stand, support the rear of the powertrain. 2. Remove Transmission Mount Strut Bracket. Refer to Transmission Mount Strut Bracket Replacement	
1	Transmission Mount Strut Bolt CAUTION: Refer to Fastener Caution CAUTION: Refer to Torque-to-Yield Fastener Caution Procedure Always use NEW bolts. - Do NOT reuse old bolts. Tighten

Callout	Component Name
	• First Pass: 100 N.m (74 lb ft) • Final Pass: 60 - 75 degrees Special Tools EN-45059 Angle Meter Equivalent regional tools: Special Tools

TRANSMISSION REPLACEMENT

Special Tools

- **BO-38185** Hose Clamp Pliers
- **DT-51504** Seal Protector
- **EN-45059** Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Ensure that the vehicle is properly supported and squarely positioned. Refer to [Lifting and Jacking the Vehicle](#) .
2. Disable the high voltage system and disconnect the A4 Hybrid/EV Battery Pack high voltage harness connector at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#) .
3. Set the parking brake.

Fig. 139: Radiator Surge Tank And Bracket Clip

Courtesy of GENERAL MOTORS COMPANY

4. Remove Radiator Surge Tank Bracket Clip (2)
5. Remove the radiator surge tank (1) from the vehicle. Refer to [Radiator Surge Tank Replacement](#)

- 42. Remove Heater Water Shutoff Valve Inlet Hose (1) @ Heater Water Shutoff Valve
- 43. Loosen the heater water shutoff valve outlet hose clamp (2), using the **BO-38185** pliers.
- 44. Remove the heater water shutoff valve outlet hose (3) with the heater water shutoff valve.

Fig. 155: Heater Water Shutoff Valve Inlet Hose And Clip

Courtesy of GENERAL MOTORS COMPANY

45. Remove Heater Water Shutoff Valve Inlet Hose (2) @ Clip (1)
46. Remove Heater Water Shutoff Valve @ Vehicle
47. Remove Heater Coolant Pump. Refer to [Heater Coolant Pump Replacement](#)

Fig. 156: Starter Opening Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

48. Remove Bolts (2) (Qty: 2)
49. Remove the starter opening cover (1).

Fig. 157: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

50. Remove the torque converter bolts. (1) (Qty: 4)

Fig. 158: Upper Front Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

51. Remove the upper front transmission bolts (1) (Qty: 2).

Fig. 159: Upper Rear Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

52. Remove the upper rear transmission bolts (1) (Qty: 2).
53. Support the transmission with a suitable jack.
54. Using a suitable straps or chains, secure the transmission to the transmission jack.

Fig. 160: Transmission Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

55. Remove the transmission bolts. (1) (Qty: 2)
56. Remove Transmission Cover (2)

Fig. 161: Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

57. Remove the transmission bolts. (1) (Qty: 2)
58. Carefully lower the transmission along with the jack, closely watching hoses and wiring harnesses to not disturb.

Fig. 162: Transmission Locating Pins

Courtesy of GENERAL MOTORS COMPANY

59. Ensure the transmission locating pins (1) are properly seated in the engine block and not damaged.
60. Transfer parts as needed.
61. Flush and flow test the fluid cooler and lines. Refer to [Transmission Fluid Cooler Flow Test and Flushing](#)

Installation Procedure

NOTE: The alignment hole is oblong and is slightly smaller than the other holes in the engine flex plate.

1. Set engine to any top dead center (TDC). This puts the alignment hole in the starter pocket.

Do not tighten bell housing bolts at this time. There must be a small 1 mm (0.039 in) to 2 mm (0.079 in) mm gap between the engine and transmission to allow rotation for input flange alignment.

2. Install 2 guide pins into the lower engine block holes where the locating pins are to guide the transmission into place.
3. Position the transmission in the vehicle on the locating pins leaving a small gap between the engine and transmission.

CAUTION: Refer to [Fastener Caution](#)

Fig. 163: Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

4. Remove the guide pins, then Install the 2 transmission bolts (1) (Qty: 2) and hand tighten, allowing a small 1 mm (0.039 in) to 2 mm (0.079 in) mm gap between the engine and transmission.

Fig. 164: Transmission Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

5. Install Transmission Cover (2)
6. Install the 2 transmission bolts (1) (Qty: 2) and hand tighten, allowing a small 1 mm (0.039 in) to 2 mm (0.079 in) mm gap between the engine and transmission.

Fig. 165: Transmission Bolt

Courtesy of GENERAL MOTORS COMPANY

7. Remove the guide pin, then install the transmission bolt (1) and hand tighten, allowing a small 1 mm (0.039 in) to 2 mm (0.079 in) mm gap between the engine and transmission.

Fig. 166: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Once the Loctite® has been applied to the bolts it will 'SET IN APPROXIMATELY IN 10 MINUTES' and will fully cure in 24 hours.

8. Apply blue Loctite® on the torque converter bolt (1). Hand start bolt a few threads in the oblong alignment hole.
9. Tighten all lower transmission bolts to 58 N.m (43 lb ft).
10. Install Heater Coolant Pump. Refer to [Heater Coolant Pump Replacement](#)

Fig. 167: Upper Front Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

11. Install the upper front transmission bolts (1) (Qty: 2) and tighten to 58 N.m (43 lb ft).

Fig. 168: Upper Rear Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

12. Install the upper rear transmission bolts (1) (Qty: 2) and tighten to 58 N.m (43 lb ft).
13. Tighten torque converter bolt to 60 N.m (44 lb ft). Rotate the engine to the next hole. Apply blue Loctite® on the three remaining torque converter bolts. Install and tighten the bolts to 60 N.m (44 lb ft).

Fig. 169: Starter Opening Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

14. Install the starter opening cover (1) and the 2 bolts (2) (Qty: 2).

Fig. 170: Bracket And Bolt

Courtesy of GENERAL MOTORS COMPANY

15. Install the bracket (2).
16. Install and tighten Bolt (1) to 9 N.m (80 lb in)

Fig. 171: Heater Water Shutoff Valve Inlet Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

17. Install Heater Water Shutoff Valve Inlet Hose (2) @ Vehicle
18. Install Heater Water Shutoff Valve Inlet Hose (2) @ Clip (1)

Fig. 172: Heater Water Shutoff Valve Electrical Connector, Inlet Hose, Retainer, Heater Water Shutoff Valve Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

19. Install the heater water shutoff valve outlet hose (3) with the heater water shutoff valve.
20. Install the heater water shutoff valve outlet hose clamp (2), using the **BO-38185** pliers.
21. Install Heater Water Shutoff Valve Inlet Hose (1) @ Heater Water Shutoff Valve
22. Install Retainer (5)
23. Connect the heater water shutoff valve electrical connector (4).

Fig. 173: Heater Water Auxiliary Pump Inlet Hose, Clamp, Heater Water Shutoff Valve Inlet Hose Bracket And Bolt

Courtesy of GENERAL MOTORS COMPANY

24. Install Heater Water Shutoff Valve Inlet Hose Bracket (2)
25. Install and tighten Heater Water Shutoff Valve Inlet Hose Bracket Bolt (1) to 22 N.m (16 lb ft)
26. Install Heater Water Auxiliary Pump Inlet Hose (4)
27. Install Heater Water Auxiliary Pump Inlet Hose Clamp (3) using **BO-38185** pliers

Fig. 174: Transmission Fluid Cooler Inlet Pipe, Bolt And Sealing Washer

Courtesy of GENERAL MOTORS COMPANY

28. Install a NEW sealing washer. (2)
29. Connect Transmission Fluid Cooler Inlet Pipe (3) - Connect
30. Install and tighten Transmission Fluid Cooler Pipe Bolt (1) to 22 N.m (16 lb ft)

Fig. 175: Transmission Fluid Cooler Outlet Pipe, Bolt And Sealing Washer
Courtesy of GENERAL MOTORS COMPANY

31. Install a NEW sealing washer. (3)
32. Connect Transmission Fluid Cooler Outlet Pipe (2)
33. Install and tighten Transmission Fluid Cooler Pipe Bolt (1) to 22 N.m (16 lb ft)
34. Install the left and right wheel drive shafts. Refer to [Front Wheel Drive Shaft Replacement](#)

Fig. 176: Transmission Fluid Cooler Inlet And Outlet Pipe Clip
Courtesy of GENERAL MOTORS COMPANY

35. Install Clip (1)
36. Install Drivetrain and Front Suspension Cradle. Refer to [Drivetrain and Front Suspension Cradle Replacement](#)
37. Install Radiator Inlet Hose. Refer to [Radiator Inlet Hose Replacement](#)

Fig. 177: Heater Inlet Hose Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

38. Install Heater Inlet Hose Bracket (2)
39. Install and tighten Bolt (1) to 9 N.m (80 lb in)

Fig. 178: Transmission Mount Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

NOTE: Install NEW bolts.

40. Install NEW Transmission Mount Bolts (1) (Qty: 3). Hand tighten only.
41. Tighten Transmission Mount Bolts (1) (Qty: 3)
 1. First Pass: 100 N.m (74 lb ft)
 2. Final Pass: 60 - 75 degrees, use the **EN-45059** meter
42. Remove Engine Support Fixture. Refer to [Engine Support Fixture](#)

Fig. 179: Ground Cable And Bolt

Courtesy of GENERAL MOTORS COMPANY

- 43. Install Ground Cable (2)
- 44. Install and tighten Ground Cable Bolt (1) to 9 N.m (80 lb in)

Fig. 180: Wiring Harness Bracket And Bolts

Courtesy of GENERAL MOTORS COMPANY

- 45. Install Wiring Harness Bracket (2)
- 46. Install and tighten Bolts (1) (Qty: 2) to 9 N.m (80 lb in)
- 47. Lower the vehicle.

Fig. 181: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

48. Connect Electrical Connector (1)

Fig. 182: Wiring Harness Bracket And Nut

Courtesy of GENERAL MOTORS COMPANY

49. Install Wiring Harness Bracket (1)

50. Install and tighten Nut (2) to 9 N.m (80 lb in)

Fig. 183: Drive Motor Generator Control Module Cooling Outlet Hose And Bolts
Courtesy of GENERAL MOTORS COMPANY

51. Install the drive motor generator control module cooling outlet hose. Refer to [Drive Motor Generator Control Module Cooling Outlet Hose Replacement \(Underbody Line\) Drive Motor Generator Control Module Cooling Outlet Hose Replacement \(Underbody Line to Traction Power Inverter Module Inlet\)](#)
52. Fill Drive Motor Generator Power Inverter Module Cooling System. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)
53. Fill Transmission Fluid. Refer to [Transmission Fluid Drain and Fill](#)
54. Fill Cooling System. Refer to [Cooling System Draining and Filling](#)

Fig. 184: Range Selector Lever Cable And Transmission Range Selector Lever Cable Bracket
Courtesy of GENERAL MOTORS COMPANY

55. Install the range selector lever cable (1) to the range selector lever cable bracket.

The retainer snaps automatically in.

Fig. 185: Range Selector Lever Cable And Range Selector Lever Cable Lever
Courtesy of GENERAL MOTORS COMPANY

- 56. Install Range Selector Lever Cable (1) @ Range Selector Lever Cable Lever
- 57. Adjust Range Selector Lever Cable. Refer to [Range Selector Lever Cable Adjustment](#)

Fig. 186: Radiator Surge Tank And Bracket Clip
Courtesy of GENERAL MOTORS COMPANY

- 58. Install Radiator Surge Tank (1)
- 59. Install Radiator Surge Tank Bracket Clip (2)
- 60. Enable the high voltage system and connect the A4 Hybrid/EV Battery Pack high voltage harness connector at the T6 Power Inverter Module. Refer to [High Voltage Disabling](#)
- 61. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
- 62. Program the power inverter module and the immobilizer control module. Refer to [Control Module References](#)

REPAIR INSTRUCTIONS - OFF VEHICLE

HOLDING FIXTURE INSTALLATION

Fig. 187: Holding Fixture Assembly

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Â WARNING: Handle with care, the transmission assembly weighs over 183 Kg (403 lbs). Bodily injury could occur if not handled properly. CAUTION: Refer to Fastener Caution . Procedure 1. Use the supplied template to relocate holes on the fixture for mounting blocks. 2. Adjust mounting blocks on DT-46625 Holding Fixture to match bosses on case and

Callout	Component Name
	tighten to 13 N.m (115 lb in).
	Special Tools • DT-03289-20 Holding Fixture Base Assembly • DT-46625 Holding Fixture • DT-46625-20 Holding Fixture Adapters
	For equivalent regional tools, refer to Special Tools .

DRIVE MOTOR POWER INVERTER MODULE COVER REMOVAL

Drive Motor Battery Positive and Negative Cable Connector Removal

Fig. 188: Drive Motor Battery Positive And Negative Cable Connector

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Battery Positive and Negative Cable Connector Removal

Callout	Component Name
1	Drive Motor Battery Positive and Negative Cable Connector Bolt (Qty: 4)
2	Drive Motor Battery Positive and Negative Cable Connector

Drive Motor Power Inverter Module Cover Removal

Fig. 189: Drive Motor Power Inverter Module Cover And Components

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Cover Removal

Callout	Component Name
1	Drive Motor Power Inverter Module Cover Bolt (Qty: 17)
2	Drive Motor Power Inverter Module Cover Procedure Use the DT-51626 protector when removing the cover to avoid damaging the connector seal. Special Tools DT-51626 Seal Protector For equivalent regional tools, refer to Special Tools .
3	Drive Motor Power Inverter Module Cover Gasket NOTE: The gasket is reusable, inspect the gasket and replace if damaged.
4	Drive Motor Power Inverter Module Cover Vent
5	Drive Motor Power Inverter Module Electrical Connector Seal NOTE: The seal is reusable,

Callout	Component Name
	inspect the seal and replace if damaged.

DRIVE MOTOR POWER INVERTER MODULE REMOVAL

Fig. 190: Drive Motor Power Inverter Module And Components
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Disconnect the 3 drive motor power inverter module connectors. 2. Using shop air, blow air through the drive motor power inverter module cooling passage on the transmission to remove residual coolant.	
1	Drive Motor Power Inverter Module 3-Phase Buss Bar Bolt (Qty: 6)
2	Drive Motor Power Inverter Module Bolt (Qty: 7)
3	Drive Motor Power Inverter Module
4	Drive Motor Power Inverter Module Fluid Seal NOTE: DISCARD the seal.

CONTROL VALVE BODY COVER REMOVAL

Fig. 191: Control Valve Body Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Control Valve Body Cover Bolt (Qty: 16)
2	Control Valve Body Cover
3	Automatic Transmission Fluid Level Control Valve Seal NOTE: The gasket is reusable, inspect the gasket and replace if damaged.
4	Automatic Transmission Fluid Level Control Valve Seal - O-ring NOTE: The seal is reusable, inspect the seal and replace if damaged.

CONTROL VALVE ASSEMBLY AND TRANSMISSION WIRING HARNESS REMOVAL

Control Solenoid Valve Removal

Fig. 192: Control Solenoid Valve

Courtesy of GENERAL MOTORS COMPANY

Control Solenoid Valve Removal

Callout	Component Name
Preliminary Procedure 1. Disconnect the control solenoid valve wiring harness. 2. Remove the connectors from the wiring harness brackets and shift detent lever.	
1	Control Valve Body Bolt (Qty: 4)
2	Control Solenoid Valve
3	Control Solenoid Valve Filter Plate NOTE: The filter plate is reusable, inspect the filter plate and replace if damaged.

Control Valve (with Body and Valve) Removal

Fig. 193: Control Valve (With Body And Valve)

Courtesy of GENERAL MOTORS COMPANY

Control Valve (with Body and Valve) Removal

Callout	Component Name
Preliminary Procedure	
Disconnect the transmission wiring harness from the control valve body.	
1	Fluid Transfer Pipe Bolt
2	Fluid Transfer Pipe
3	Control Valve Body Bolt (Qty: 13)
4	Control Valve (with Body and Valve)
5	Control Valve Body Spacer Plate Retainer (Qty: 2)
6	Control Valve Lower Body Spacer Plate
7	Variable Low Clutch Fluid Passage Seal

Automatic Transmission Wiring Harness Removal

Fig. 194: Automatic Transmission Wiring Harness
 Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Wiring Harness Removal

Callout	Component Name
Preliminary Procedure	
1. Disconnect the wiring harness connector from the manual shift detent lever and remove the connectors from the wiring harness brackets noting location for installation. 2. Remove the manual shift detent lever spring to aid in removal of the transmission wiring harness.	
1	Automatic Transmission Wiring Harness - Control Solenoid Valve
2	Automatic Transmission Wiring Connector Seal
3	Automatic Transmission Wiring Harness - Shift Shaft Position Switch
4	Automatic Transmission Wiring Connector Seal

AUTOMATIC TRANSMISSION TORQUE DAMPENER AND DIFFERENTIAL HOUSING REMOVAL

Fig. 195: Automatic Transmission Torque Dampener And Differential Housing
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Torque Converter and Differential Housing Bolt (Qty: 16)
2	Automatic Transmission Torque Dampener and Differential Housing NOTE: The input internal gear assembly could stick to the torque dampener and differential housing.
3	Automatic Transmission Torque Dampener and Differential Housing Gasket NOTE: DISCARD the gasket.

FRONT DIFFERENTIAL CARRIER REMOVAL

Fig. 196: Front Differential Carrier

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Carrier Bearing
2	Front Differential Carrier
3	Front Differential Carrier Sun Gear
4	Differential Carrier Sun Gear Thrust Bearing

INPUT SUN GEAR SHAFT REMOVAL

Fig. 197: Input Sun Gear Shaft

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input Internal Gear Thrust Bearing
2	Input Sun Gear Shaft Assembly
3	Input Sun Gear Retaining Ring
4	Input Sun Gear
5	Input Sun Gear Shaft
6	Variable High Clutch Housing Seal
	NOTE: DISCARD the seal.

FRONT DIFFERENTIAL CARRIER BAFFLE REMOVAL

Fig. 198: Front Differential Carrier Baffle
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Carrier Baffle Bolt (Qty: 2)
2	Front Differential Carrier Baffle
3	Automatic Transmission Fluid Chip Collector Magnet

DRIVE SPROCKET, DRIVEN SPROCKET, AND DRIVE LINK REMOVAL

Fig. 199: Drive Sprocket, Driven Sprocket And Drive Link
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Sprocket, Driven Sprocket, and Drive Link NOTE: Inspect the bearing that is pressed into the driven sprocket. If the bearing is loose, replace the driven sprocket.
2	Driven Sprocket Bearing

DRIVE LINK SNUBBER REMOVAL

Fig. 200: Drive Link Snubber

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Link Snubber Bolt (Qty: 2)
2	Drive Link Snubber
3	NOTE: A plastic washer is used on the bolts during initial assembly. These washers may come loose after bolt removal. Ensure that the washers do not drop into the transmission case. Discard the washers. Drive Link Snubber Bolt (Coast Side) (Qty: 2)

Callout	Component Name
4	Drive Link Snubber (Coast Side)

AUTOMATIC TRANSMISSION FLUID PUMP AND FLUID FILTER REMOVAL

Fig. 201: Automatic Transmission Fluid Pump And Fluid Filter
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Disconnect the fluid pump pass thru connector from the case.	
1	Automatic Transmission Fluid Pump Bolt (Qty: 3)
2	NOTE: Guide the fluid pump wiring harness from the case. Automatic Transmission Fluid Pump
3	NOTE: DISCARD the seal. Automatic Transmission Pump Fluid Outlet Seal
4	Automatic Transmission Fluid Filter Bolt

Callout	Component Name
5	Automatic Transmission Fluid Filter
6	NOTE: DISCARD the seal. Automatic Transmission Fluid Filter Seal

MANUAL SHIFT DETENT LEVER WITH SHAFT POSITION SWITCH ASSEMBLY AND PARK PAWL ACTUATOR REMOVAL

Automatic Transmission Wiring Harness Bracket Removal

Fig. 202: Automatic Transmission Wiring Harness Bracket
Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Wiring Harness Bracket Removal

Callout	Component Name
Preliminary Procedure	
Remove the drive motor wiring harness connectors from the wiring harness connector brackets.	
1	Automatic Transmission Wiring Harness Connector Bracket Bolt (Qty: 1)
2	Automatic Transmission Wiring Harness Bracket
3	Automatic Transmission Wiring Harness Connector Bracket Bolt (Qty: 1)
4	Automatic Transmission Wiring Harness Bracket

Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Removal

Fig. 203: Manual Shift Detent Lever With Shaft Position Switch Assembly And Park Pawl Actuator
 Courtesy of GENERAL MOTORS COMPANY

Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Removal

Callout	Component Name
1	Manual Shift Detent Lever Spring
2	Park Pawl
3	Park Pawl Spring
4	Park Pawl Shaft
5	Park Pawl Actuator Guide Bolt
6	Park Pawl Actuator Guide
7	Manual Shift Detent Lever Pin
8	Manual Shift Shaft Pin NOTE: DISCARD the manual shift shaft pin.
9	Manual Shift Detent Lever Shaft
10	Manual Shift Detent Lever
11	Park Pawl Actuator

DRIVE MOTOR REMOVAL - 2ND POSITION

Drive Motor Stator Cooling Tube Removal

Fig. 204: Drive Motor Stator Cooling Tube

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Stator Cooling Tube Removal

Callout	Component Name
1	Automatic Transmission Output Speed Sensor Bolt
2	Automatic Transmission Output Speed Sensor
3	Drive Motor Stator Cooling Tube Bolt (Qty: 2) NOTE: A plastic washer is used on the bolts during initial assembly. These washers may come loose after bolt removal. Ensure that the washers do not drop into the transmission case. Discard the

Callout	Component Name
	washers.
4	Drive Motor Stator Cooling Tube

Drive Motor - 2nd Position Bolt Removal

Fig. 205: Drive Motor - 2nd Position Bolts
 Courtesy of GENERAL MOTORS COMPANY

Drive Motor - 2nd Position Bolt Removal

Callout	Component Name
1	Automatic Transmission Case Extension Bolt (Qty: 2)
2	Automatic Transmission Case Extension Bolt (Qty: 1) NOTE: DISCARD the bolt.
3	Automatic Transmission Case Extension Bolt (Qty: 1) NOTE: DISCARD the bolt.
4	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3)

Drive Motor - 2nd Position Removal

Fig. 206: Drive Motor - 2nd Position

Courtesy of GENERAL MOTORS COMPANY

Drive Motor - 2nd Position Removal

Callout	Component Name
1	Drive Motor - 2nd Position WARNING: The generator motor weighs approximately 23 kg (50 lbs). Personal injury may result if you lift the generator motor improperly. CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils.

Callout	Component Name
	Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage. Procedure 1. Install the DT-51623 motor lift bar. 2. Attach a lift assist hook through the DT-51623 motor lift bar. 3. Guide the drive motor resolver wire through the transmission case while lifting the drive motor using a lift assist. 4. Set the drive motor on its side on a clean lint free cloth. DO NOT rest the drive motor on the stator end coils. 5. Detach the lift assist hook and remove the DT-51623 motor lift bar. 6. Carefully tip over the drive motor flat onto the work surface resting on it cast aluminum support. Special Tools DT-51623 Motor Lift Bar For equivalent regional tools, refer to <u>Special Tools</u>.

Drive Motor Power Inverter Module Connector Removal

Fig. 207: Drive Motor Power Inverter Module Connector

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Connector Removal

Callout	Component Name
1	Drive Motor Power Inverter Module Connector Bolt NOTE: DISCARD the bolt.
2	Drive Motor Power Inverter Module Connector NOTE: DISCARD the connector.

OUTPUT CARRIER AND OUTPUT CARRIER INTERNAL GEAR REMOVAL

Fig. 208: Output Carrier And Output Carrier Internal Gear

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Output Carrier
2	Output Carrier Thrust Bearing
3	Output Carrier Internal Gear
4	Output Carrier Internal Gear Hub Thrust Bearing

DRIVE MOTOR REMOVAL - 1ST POSITION

Drive Motor - 1st Position Removal

Fig. 209: Drive Motor - 1st Position

Courtesy of GENERAL MOTORS COMPANY

Drive Motor - 1st Position Removal

Callout	Component Name
1	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3)
2	Automatic Transmission Case Extension Bolt (Qty: 4)
3	Drive Motor - 1st Position WARNING: The generator motor weighs approximately 23 kg (50 lbs). Personal injury may result if you lift the generator motor improperly. CAUTION: DO NOT contact or rest the drive motor stator on the

Callout	Component Name
	copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage. Procedure 1. Install the DT-51623 motor lift bar. 2. Attach a lift assist hook through the DT-51623 motor lift bar. 3. Guide the drive motor resolver wire through the transmission case while lifting the drive motor using a lift assist. 4. Set the drive motor on its side on a clean lint free cloth. DO NOT rest the drive motor on the stator end coils. 5. Detach the lift assist hook and remove the DT-51623 motor lift bar. 6. Carefully tip over the drive motor flat onto the work surface resting on it cast aluminum support. Special Tools DT-51623 Motor Lift Bar For equivalent regional tools, refer to Special Tools.

Drive Motor Power Inverter Module Connector Removal

Fig. 210: Drive Motor Power Inverter Module Connector

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Connector Removal

Callout	Component Name
1	Drive Motor Power Inverter Module Connector Bolt NOTE: DISCARD the bolt.
2	Drive Motor Power Inverter Module Connector NOTE: DISCARD the connector.

VARIABLE HIGH CLUTCH FLUID TRANSFER SUPPORT SEAL OVERHAUL

Fig. 211: Variable High Clutch Fluid Transfer Support Seal

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: Refer to Seal Reuse Caution .	
1	Variable High Clutch Fluid Transfer Support Seal (Qty: 2) CAUTION: Size the fluid seal rings for at least 5 minutes after installation to obtain proper seal ring size. Failure to do so may cause internal transmission leaks and transmission damage.

Callout	Component Name
	Procedure 1. Use the DT-50911-2 pusher and adjustment screw from DT-50911-3 with DT-51700 installer to install the seals. 2. Adjust the turn screw on the protector and install the bottom seal ring first. 3. Use the large taper side of DT-51700 seal sizer for initial seal sizing, then flip the tool over for final sizing. 4. Leave DT-51700 seal sizer in place until the drive motor is ready to be installed. NOTE: Use NEW seals. Special Tools • DT-50911 Seal Installer • DT-51700 Seal Installer For equivalent regional tools, refer to Special Tools.
2	Variable High Clutch Fluid Transfer Support Seal - O-Ring NOTE: Use a NEW seal.
3	Variable High Clutch Fluid Seal Ring NOTE: Use a NEW seal.

FRONT WHEEL DRIVE SHAFT OIL SEAL REMOVAL - LEFT SIDE

Fig. 212: Front Wheel Drive Shaft Oil Seal - Left Side

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal Special Tools • DT-23129 Universal Seal Remover • GE-6125-1B Slide Hammer For equivalent regional tools, refer to Special Tools.

TRANSMISSION CASE CLEANING AND INSPECTION

Transmission Case Inspection (1 of 2)

Fig. 213: Transmission Case Inspection (1 Of 2)
 Courtesy of GENERAL MOTORS COMPANY

Transmission Case Inspection (1 of 2)

Callout	Component Name
CAUTION: Do not use abrasive pads or bristle devices to clean the sealing surfaces. Abrasive pads produce a fine grit that can effect transmission function. Abrasive pads can also remove enough metal to create oil leaks.	

Callout	Component Name
CAUTION: After CAUTION: Do not use any cleaning agents, solvents, or dry-cleaning compounds. Do not use a cloth or paper towels in order to dry the transmission components. Lint from the towels can cause premature component failure. Thoroughly clean the transmission case assembly, including case threads, with clean solvent. 2. Clean gasket sealing surfaces. Remove all residual gasket material. 3. Inspect all threaded holes. If necessary, repair any thread damage.	
1	Drive Motor Power Inverter Module Cover Pin
2	Transmission Case Locating Pin
3	Automatic Transmission Fluid Pump Locating Pin
4	Driven Sprocket Bearing Mating Surface
5	Transmission Case to Torque Dampener and Differential Housing Sealing Surface
6	Drive Motor Power Inverter Module Pin
7	Transmission Fluid Filler Cap

Fig. 214: Transmission Case Inspection (2 Of 2)
 Courtesy of GENERAL MOTORS COMPANY

Transmission Case Inspection (2 of 2)

Callout	Component Name
1	Transmission Fluid Cooler Pipe Sealing Surface (Qty: 2)
2	Automatic Transmission Case Plug
3	Automatic Transmission Fluid Level Hole Plug
4	Transmission Fluid Drain Plug
5	Transmission Case to Control Valve Body Cover Sealing Surface

FRONT WHEEL DRIVE SHAFT OIL SEAL INSTALLATION - LEFT SIDE

Fig. 215: Front Wheel Drive Shaft Oil Seal - Left Side

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal Special Tools • DT-46629-A Axle Seal Installer • GE-8092 Driver Handle For equivalent regional tools, refer to Special Tools.

MANUAL SHIFT SHAFT SEAL REMOVAL

Fig. 216: Manual Shift Shaft Seal

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Seal Special Tools DT-45201 Seal Remover For equivalent regional tools, refer to Special Tools .

VARIABLE LOW CLUTCH PLATE REMOVAL

Fig. 217: Variable Low Clutch Plate

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle	

Callout	Component Name
operation, resulting in component damage.	
Service the variable low clutch with the variable high clutch installed onto the drive motor rotor. This will prevent contact of the drive motor stator copper end coils with the work surface.	
1	Variable Low Clutch Backing Plate Retaining Ring Procedure Use DT-47694 compressor and a suitable press to remove the retaining ring. NOTE: DISCARD the retaining ring. Special Tools DT-47694 Piston Spring Compressor For equivalent regional tools, refer to <u>Special Tools</u> .
2	Variable Low Clutch Backing Plate
3	Variable Low Clutch Plate - Friction (Qty: 3)
4	Variable Low Clutch Plate (Qty: 3)
5	Variable Low Clutch Spring
6	Variable Low Clutch Piston Procedure Use compressed air in the drive motor fluid feed passage to remove the piston.

VARIABLE HIGH CLUTCH REMOVAL

Fig. 218: Variable High Clutch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage.	
1	Variable High Clutch Housing Bolt (Qty: 8)
2	Variable High Clutch Housing
3	Variable High Clutch Hub Thrust Washer
4	Variable High Clutch Hub
5	Variable High Clutch Hub Thrust Washer

DRIVE MOTOR DISASSEMBLE - 1ST POSITION

Drive Motor Stator and Rotor Removal

Fig. 219: Drive Motor Stator And Rotor
Courtesy of GENERAL MOTORS COMPANY

Drive Motor Stator and Rotor Removal

Callout	Component Name
1	Drive Motor Rotor Bearing Retaining Ring NOTE: DISCARD the retaining ring.
2	Drive Motor Rotor NOTE: The drive motor rotor is strongly magnetic. DO NOT place within 6 inches of ferrous metallic components.

Callout	Component Name
	NOTE: Place the drive motor stator on a lint free cloth to prevent metallic debris from adhering to the outer diameter. Special Tools DT-51621 Rotor Remove/Installer For equivalent regional tools, refer to Special Tools.
3	Drive Motor Stator Bolt (Qty: 4) NOTE: from discarding the bolts.
4	Drive Motor Stator CAUTION: DO NOT touch the contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage. NOTE: Place the drive motor stator on a lint free cloth over a piece of cardboard.
5	Drive Motor Position Sensor Bolt (Qty: 1) NOTE: DISCARD the bolts.
6	Drive Motor Position Sensor Connector Clip

Callout	Component Name
7	Drive Motor Position Sensor Bolt (Qty: 3) NOTE: DISCARD the bolts.
8	Drive Motor Position Sensor Stator

Drive Motor Power Inverter Module Cable Guide Assembly Removal

Fig. 220: Drive Motor Power Inverter Module Cable Guide Assembly
 Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Cable Guide Assembly Removal

Callout	Component Name
1	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3)
2	Drive Motor Power Inverter Module Cable Bolt Install Guide Retainer (Qty: 3)
3	Drive Motor Power Inverter Module Cable Bolt Install Guide Bushing (Qty: 3)

1	Drive Motor Power Inverter Module Cable Guide
2	Drive Motor Power Inverter Module Cable Bolt Install Guide Bushing (Qty: 3)
3	Drive Motor Power Inverter Module Cable Bolt Install Guide Retainer (Qty: 3)
4	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3)

Drive Motor Stator and Rotor Installation

Fig. 222: Drive Motor Stator And Rotor
 Courtesy of GENERAL MOTORS COMPANY

Drive Motor Stator and Rotor Installation

Callout	Component Name
1	Drive Motor Position Sensor Stator

Callout	Component Name
2	Drive Motor Position Sensor Bolt (Qty: 3) CAUTION: Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure Use Threadlocker Red on the bolt threads. Refer to Adhesives, Fluids, Lubricants, and Sealers. NOTE: Use NEW bolts. Tighten 5 N.m (44 lb in)
3	Drive Motor Position Sensor Connector Clip
4	Drive Motor Position Sensor Bolt (Qty: 1) CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure Use Threadlocker Red on the bolt threads. Refer to Adhesives, Fluids, Lubricants, and Sealers. NOTE: Use NEW bolts. Tighten 5 N.m (44 lb in)

Callout	Component Name
5	Drive Motor Stator CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage.
6	Drive Motor Stator Bolt (Qty: 4) CAUTION: Refer to <u>Torque-to-Yield</u> <u>Fastener</u> <u>Caution</u> . NOTE: Use NEW bolts. Tighten 11 N.m (97 lb in)
7	Drive Motor Rotor NOTE: The drive motor rotor bearing retaining ring groove will be visible when the drive

Callout	Component Name
	motor rotor is completely installed. It may be necessary to jiggle the DT-51621 installer to allow the rotor to fully drop into position. NOTE: The drive motor rotor is strongly magnetic. DO NOT place within 6 inches of ferrous metallic components. Metallic debris can be removed from the motor outer diameter by blotting with adhesive tape. Special Tools DT-51621 Rotor Remove/Installer For equivalent regional tools, refer to Special Tools.
8	Drive Motor Rotor Bearing Retaining Ring NOTE: Install a NEW retaining ring.

VARIABLE HIGH CLUTCH DISASSEMBLE

Variable High Clutch Plate Removal

Variable High Clutch Piston Installation

Callout	Component Name
---------	----------------

Callout	Component Name
CAUTION: Refer to Seal Reuse Caution . Preliminary Procedure Lubricate all seals with automatic transmission fluid (ATF) prior to installation.	
1	Variable High Clutch Piston Inner Seal NOTE: Use a NEW seal.
2	Variable High Clutch Piston Dam Inner Seal NOTE: Use a NEW seal.
3	Variable High Clutch Piston Dam Outer Seal NOTE: Use a NEW seal.
4	Variable High Clutch Piston Special Tools DT-48903 Spring Compressor For equivalent regional tools, refer to Special Tools .
5	Variable High Clutch Piston Spring
6	Variable High Clutch Piston Outer Seal NOTE: Use a NEW seal.
7	Variable High Clutch Piston Dam Special Tools • DT-48903 Spring Compressor • DT-51669 Protector For equivalent regional tools, refer to Special Tools .
8	Variable High Clutch Piston Dam Retaining Ring CAUTION: Refer to Retaining Ring Reuse Caution . Procedure

Callout	Component Name
	Use a press and DT-48903 compressor against the variable high clutch piston dam to install the retaining ring. NOTE: DO NOT exceed 5.0 mm (0.20 in) of travel below the snap ring groove when compressing the variable high clutch piston dam. NOTE: Use a NEW retaining ring. Special Tools DT-48903 Spring Compressor For equivalent regional tools, refer to <u>Special Tools.</u>

Variable High Clutch Plate Installation

Fig. 226: Variable High Clutch Plate

Courtesy of GENERAL MOTORS COMPANY

Variable High Clutch Plate Installation

Callout	Component Name
1	Variable High Clutch Waved Plate
2	Variable High Clutch Plate (Qty: 3)
3	Variable High Clutch Plate - Friction (Qty: 3)
4	Variable High Clutch Backing Plate
5	Variable High Clutch Backing Plate Retaining Ring
	Procedure Select the correct retaining ring. Refer to Variable High Clutch Backing Plate Retaining Ring Measurement .

VARIABLE HIGH CLUTCH BACKING PLATE RETAINING RING MEASUREMENT

Fig. 227: Variable High Clutch Backing Plate Retaining Ring Measurement
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Assemble the variable high clutch. Refer to Variable High Clutch Assemble .	
1	Variable High Clutch Backing Plate Retaining Ring Procedure 1. Assemble the tools as shown and clamp the DT-50900 fixture to the bench. 2. Apply 20 pounds of pressure to the load gauge by turning the screw on the DT-50900 fixture clockwise. 3. Zero out the dial indicator. 4. Remove the pressure on the load gauge by turning the screw on the DT-50900 fixture one full turn counterclockwise. 5. Apply 50 PSI of compressed air and simultaneously adjust the screw on the DT-50900 fixture to apply 20 pounds of pressure to the load gauge. 6. Observe the dial indicator measurement. Refer to Clutch Backing Plate Retaining Ring Specifications to determine the correct variable high clutch backing plate retaining ring. Special Tools • DT-50900 Clutch Travel Support Fixture • DT-50903 Clutch Travel Load Gauge • DT-50905 Clutch Travel Air Adapter • DT-51627 Clutch Travel Air Adapter

Callout	Component Name
	• GE-8001 Dial Indicator Set • J-23327-1 Clutch Spring Compressor For equivalent regional tools, refer to Special Tools.

VARIABLE HIGH CLUTCH INSTALLATION

Fig. 228: Variable High Clutch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Variable High Clutch Hub Thrust Washer
2	Variable High Clutch Hub
3	Variable High Clutch Hub Thrust Washer
4	Variable High Clutch Housing Special Tools DT-51628 Clutch Holder For equivalent regional tools, refer to Special Tools .
5	Variable High Clutch Housing Bolt (Qty: 8) CAUTION: Refer to Fastener Caution .

Callout	Component Name
	Tighten 9 N.m (80 lb in)

VARIABLE LOW CLUTCH PLATE INSTALLATION

Fig. 229: Variable Low Clutch Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils	

Callout	Component Name
may cause a high voltage short during vehicle operation, resulting in component damage. Preliminary Procedure Service the variable low clutch with the variable high clutch installed onto the drive motor rotor. This will prevent contact of the drive motor stator copper end coils with the work surface.	
1	Variable Low Clutch Piston
2	Variable Low Clutch Spring
3	Variable Low Clutch Plate (Qty: 3)
4	Variable Low Clutch Plate - Friction (Qty: 3)
5	Variable Low Clutch Backing Plate
6	Variable Low Clutch Backing Plate Retaining Ring - Selective Procedure 1. Select the correct retaining ring. Refer to: Variable Low Clutch Backing Plate Retaining Ring Measurement. 2. Use DT-47694 compressor and a suitable press to install the retaining ring. Special Tools DT-47694 Piston Spring Compressor For equivalent regional tools, refer to Special Tools.

VARIABLE LOW CLUTCH BACKING PLATE RETAINING RING MEASUREMENT

Fig. 230: Variable Low Clutch Backing Plate Retaining Ring Measurement

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure - Assemble the variable low clutch. Refer to Variable Low Clutch Plate Installation. CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage. - Service the variable low clutch with the variable high clutch installed onto the drive motor rotor. This will prevent contact of the drive motor stator copper end coils with the work surface.	

DRIVE MOTOR INSTALLATION - 1ST POSITION

Drive Motor Power Inverter Module Connector Installation

Fig. 231: Drive Motor Power Inverter Module Connector
Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Connector Installation

Callout	Component Name
1	Drive Motor Power Inverter Module Connector NOTE: Use a NEW connector.
2	Drive Motor Power Inverter Module Connector Bolt Procedure Use Threadlocker Blue on the bolt threads. Refer to Adhesives, Fluids, Lubricants, and Sealers . NOTE: Install a NEW bolt. Tighten 9 N.m (80 lb in)

Drive Motor - 1st Position Installation

Fig. 232: Drive Motor - 1st Position

Courtesy of GENERAL MOTORS COMPANY

Drive Motor - 1st Position Installation

Callout	Component Name
1	Drive Motor - 1st Position WARNING: The generator motor weighs approximately 23 kg (50 lbs). Personal injury may result if you lift the generator motor improperly. CAUTION:

Callout	Component Name
	DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage. Procedure 1. Install the DT-51623 motor lift bar. 2. Install the DT-51624 alignment pins. 3. Carefully tip the drive motor onto its side, resting on the cast aluminum support. Never rest the drive motor on the stator copper end coils. 4. Attach a lift assist hook through the DT-51623 motor lift bar handle hole and carefully raise the drive motor while holding it to rotate into position for assembly. 5. Carefully lower the drive motor into the transmission case ensuring the copper end coils do not contact any metallic parts. NOTE: Ensure the seal sizer has been removed from the variable high clutch fluid transfer seals. 6. Use the DT-51624 alignment pins to guide the drive motor into position. 7. Guide the drive motor resolver wire through the transmission case while lowering the drive motor using a lift assist. 8. The drive motor should sit below the cast line in the transmission case when properly installed. Special Tools

Callout	Component Name
	• DT-51623 Motor Lift Bar • DT-51624 Alignment Pins For equivalent regional tools, refer to Special Tools.
2	Automatic Transmission Case Extension Bolt (Qty: 4) CAUTION: Refer to Fastener Caution . Tighten 26 N.m (19 lb ft)
3	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3) Tighten 9 N.m (80 lb in)

OUTPUT CARRIER INTERNAL GEAR OVERHAUL

Fig. 233: Output Carrier Internal Gear
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Output Carrier Internal Gear Retaining Ring
2	Output Carrier Internal Gear Hub

Callout	Component Name
3	Output Carrier Internal Gear

OUTPUT CARRIER AND OUTPUT CARRIER INTERNAL GEAR INSTALLATION

Fig. 234: Output Carrier And Output Carrier Internal Gear
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Output Carrier Internal Gear Hub Thrust Bearing
2	Output Carrier Internal Gear
3	Output Carrier Thrust Bearing
4	Output Carrier

DRIVE MOTOR DISASSEMBLE - 2ND POSITION

Drive Motor Rotor Removal

Fig. 235: Drive Motor Rotor

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Rotor Removal

Callout	Component Name
1	Output Sun Gear Retaining Ring
2	Output Sun Gear
3	Drive Motor Rotor Bearing Retaining Ring NOTE: DISCARD the retaining ring.
4	Drive Motor Rotor NOTE: The drive motor rotor is strongly magnetic. DO NOT place within 6 inches of ferrous metallic components. NOTE:

Callout	Component Name
	Place the drive motor rotor on a lint free cloth to prevent metallic debris from adhering to the outer diameter. Metallic debris can be removed from the motor outer diameter by blotting with adhesive tape. Special Tools DT-51621 Rotor Remover/Installer For equivalent regional tools, refer to Special Tools.

Drive Motor Stator Removal

Fig. 236: Drive Motor Stator

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Stator Removal

Callout	Component Name
1	Drive Motor Stator Bolt (Qty: 4) NOTE: DISCARD the bolts.
2	Drive Motor Stator CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage. NOTE: Place the drive motor stator on a lint free cloth over a piece of cardboard.
3	Drive Motor Position Sensor Bolt (Qty: 1) NOTE: DISCARD the bolts.
4	Drive Motor Position Sensor Connector Clip
5	Drive Motor Position Sensor Bolt (Qty: 3) NOTE:

Callout	Component Name
	DISCARD the bolts.
6	Drive Motor Position Sensor Stator
7	Drive Motor Support NOTE: The drive motor support is a mandatory replacement component. Discard the drive motor support.

Drive Motor Power Inverter Module Cable Guide Removal

Fig. 237: Drive Motor Power Inverter Module Cable Guide Assembly
 Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Cable Guide Removal

Callout	Component Name
1	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3)
2	Drive Motor Power Inverter Module Cable Bolt Install Guide Retainer (Qty: 3)
3	Drive Motor Power Inverter Module Cable Bolt Install Guide Bushing (Qty: 3)
4	Drive Motor Power Inverter Module 3-Phase Cable Guide Assembly

DRIVE MOTOR ASSEMBLE - 2ND POSITION

Drive Motor Power Inverter Module Cable Guide Installation

Fig. 238: Drive Motor Power Inverter Module Cable Guide

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Cable Guide Installation

Callout	Component Name
1	Drive Motor Power Inverter Module Cable Guide
2	Drive Motor Power Inverter Module Cable Bolt Install Guide Bushing (Qty: 3)
3	Drive Motor Power Inverter Module Cable Bolt Install Guide Retainer (Qty: 3)
4	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3)

Drive Motor Stator Installation

Fig. 239: Drive Motor Stator

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Stator Installation

Callout	Component Name
1	Drive Motor Support NOTE: The drive motor support is a mandatory replacement component. Install a NEW drive motor support.
2	Drive Motor Position Sensor Stator
3	Drive Motor Position Sensor Bolt (Qty: 3) CAUTION: Refer to Fastener Caution . CAUTION:

Callout	Component Name
	Refer to <u>Torque-to-Yield</u> <u>Fastener</u> <u>Caution</u> . Procedure Use Threadlocker Red on the bolt threads. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. NOTE: Use NEW bolts. Tighten 5 N.m (44 lb in)
4	Drive Motor Position Sensor Connector Clip
5	Drive Motor Position Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Torque-to-Yield</u> <u>Fastener</u> <u>Caution</u> . NOTE: Use NEW bolts. Tighten 5 N.m (44 lb in)
6	Drive Motor Stator CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils

Callout	Component Name
	may cause a high voltage short during vehicle operation, resulting in component damage.
7	Drive Motor Stator Bolt (Qty: 4) CAUTION: Refer to Torque-to-Yield Fastener Caution . NOTE: Use NEW bolts. Tighten 11 N.m (97 lb in)

Drive Motor Rotor Installation

Fig. 240: Drive Motor Rotor
Courtesy of GENERAL MOTORS COMPANY

Drive Motor Rotor Installation

Callout	Component Name
---------	----------------

Callout	Component Name
1	Drive Motor Rotor NOTE: The drive motor rotor bearing retaining ring groove will be visible when the drive motor rotor is completely installed. It may be necessary to jiggle the DT-51621 installer to allow the rotor to fully drop into position. NOTE: The drive motor rotor is strongly magnetic. DO NOT place within 6 inches of ferrous metallic components. Metallic debris can be removed from the motor outer diameter by blotting with adhesive tape. Special Tools DT-51621 Rotor Remover/Installer

Callout	Component Name
	For equivalent regional tools, refer to Special Tools .
2	Drive Motor Rotor Bearing Retaining Ring NOTE: Install a NEW retaining ring.
3	Output Sun Gear
4	Output Sun Gear Retaining Ring

DRIVE MOTOR INSTALLATION - 2ND POSITION

Drive Motor Power Inverter Module Connector Installation

Fig. 241: Drive Motor Power Inverter Module Connector

Courtesy of GENERAL MOTORS COMPANY

Drive Motor Power Inverter Module Connector Installation

Callout	Component Name
1	Drive Motor Power Inverter Module Connector NOTE: Use a NEW connector.

Callout	Component Name
2	Drive Motor Power Inverter Module Connector Bolt (Qty: 1) Procedure Use Threadlocker Blue on the bolt threads. Refer to Adhesives, Fluids, Lubricants, and Sealers. NOTE: Install a NEW bolt. Tighten 9 N.m (80 lb in)

Drive Motor - 2nd Position Installation

Fig. 242: Drive Motor - 2nd Position
Courtesy of GENERAL MOTORS COMPANY

Drive Motor - 2nd Position Installation

Callout	Component Name
1	Drive Motor - 2nd Position WARNING: The generator motor weighs approximately 23 kg (50 lbs).

Callout	Component Name
	Personal injury may result if you lift the generator motor improperly. CAUTION: DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage. Procedure 1. Install the DT-51623 motor lift bar. 2. Carefully tip the drive motor onto its side, resting on the cast aluminum support. Never rest the drive motor on the stator copper end coils. 3. Attach a lift assist hook through the DT-51623 motor lift bar handle hole and carefully raise the drive motor while holding it to rotate into position for assembly. 4. Carefully lower the drive motor into the transmission case ensuring the copper end coils do not contact any metallic parts. 5. Guide the drive motor resolver wire through the transmission case while lowering the drive motor using a lift assist. 6. If the drive motor will not fully seat, raise the drive motor up with the lift assist so that the planetary gear set can be rotated slightly to engage the sun gear on the drive motor. 7. Repeat step 5 until the drive motor can be fully seated. DO NOT rock, shake, or hammer the drive motor to seat it. Special Tools DT-51623 Motor Lift Bar For equivalent regional tools, refer to <u>Special Tools</u>.

Drive Motor - 2nd Position Bolt Installation

Fig. 243: Drive Motor - 2nd Position Bolts
Courtesy of GENERAL MOTORS COMPANY

Drive Motor - 2nd Position Bolt Installation

Callout	Component Name
1	Automatic Transmission Case Extension Bolt (Qty: 1) NOTE: Use NEW bolts. Tighten 38 N.m (28 lb ft)
2	Automatic Transmission Case Extension Bolt (Qty: 1) NOTE: Use NEW bolts. Tighten 38 N.m (28 lb ft)
3	Automatic Transmission Case Extension Bolt (Qty: 2) Tighten 38 N.m (28 lb ft)

Callout	Component Name
4	Drive Motor Power Inverter Module 3-Phase Cable Bolt (Qty: 3) Tighten 9 N.m (80 lb in)

Drive Motor Stator Cooling Tube Installation

Fig. 244: Drive Motor Stator Cooling Tube
 Courtesy of GENERAL MOTORS COMPANY

Drive Motor Stator Cooling Tube Installation

Callout	Component Name
1	Drive Motor Stator Cooling Tube
2	Drive Motor Stator Cooling Tube Bolt (Qty: 2) Tighten 9 N.m (80 lb in)
3	Automatic Transmission Output Speed Sensor
4	Automatic Transmission Output Speed Sensor Bolt Tighten 9 N.m (80 lb in)

MANUAL SHIFT DETENT LEVER WITH SHAFT POSITION SWITCH ASSEMBLY AND PARK PAWL ACTUATOR INSTALLATION

Automatic Transmission Wiring Harness Bracket Installation

Fig. 245: Automatic Transmission Wiring Harness Bracket

Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Wiring Harness Bracket Installation

Callout	Component Name
1	Automatic Transmission Wiring Harness Bracket
2	Automatic Transmission Wiring Harness Connector Bracket Bolt (Qty: 1) CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 9 N.m (80 lb in)
3	Automatic Transmission Wiring Harness Bracket
4	Automatic Transmission Wiring Harness Connector Bracket Bolt (Qty: 1) Tighten 9 N.m (80 lb in)

Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Installation

Fig. 246: Manual Shift Detent Lever With Shaft Position Switch Assembly And Park Pawl Actuator
 Courtesy of GENERAL MOTORS COMPANY

Manual Shift Detent Lever with Shaft Position Switch Assembly and Park Pawl Actuator Installation

Callout	Component Name
1	Park Pawl Actuator
2	Manual Shift Detent Lever
3	Manual Shift Detent Lever Shaft
4	Manual Shift Shaft Pin CAUTION: The manual shift shaft pin must be installed before the manual shift detent lever pin. Use the special tool, DT-51436, to install the manual shift shaft pin to the proper depth. Failure to follow these steps may result in damage to

Callout	Component Name
	the transmission. Procedure Install the manual shift shaft pin before installing the manual shift detent lever pin. Special Tools DT-51436 Manual Shaft Pin Installer For equivalent regional tools, refer to Special Tools.
5	Manual Shift Detent Lever Pin
6	Park Pawl Actuator Guide
7	Park Pawl Actuator Guide Bolt Tighten 14 N.m (124 lb in)
8	Park Pawl Shaft
9	Park Pawl Spring
10	Park Pawl
11	Manual Shift Detent Lever Spring Tighten 9 N.m (80 lb in)

MANUAL SHIFT SHAFT SEAL INSTALLATION

Fig. 247: Manual Shift Shaft Seal

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Seal Special Tools DT-51672 Seal Installer For equivalent regional tools, refer to Special Tools .

AUTOMATIC TRANSMISSION FLUID PUMP AND FLUID FILTER INSTALLATION

Fig. 248: Automatic Transmission Fluid Pump And Fluid Filter
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Filter Seal
2	Automatic Transmission Fluid Filter
3	Automatic Transmission Fluid Filter Bolt CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
4	Automatic Transmission Pump Fluid Outlet Seal
5	Automatic Transmission Fluid Pump Procedure Connect the fluid pump pass thru connector to the case.

Callout	Component Name
6	Automatic Transmission Fluid Pump Bolt (Qty: 3) Tighten 22 N.m (16 lb ft)

DRIVE LINK SNUBBER INSTALLATION

Fig. 249: Drive Link Snubber
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Link Snubber - Coast Side
2	Drive Link Snubber Bolt (Qty: 2) CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 9 N.m (80 lb in)
3	Drive Link Snubber - Drive Side
4	Drive Link Snubber Bolt (Qty: 2) Tighten 9 N.m (80 lb in)

FRONT DIFFERENTIAL CARRIER BAFFLE INSTALLATION

Fig. 250: Front Differential Carrier Baffle
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Chip Collector Magnet
2	Front Differential Carrier Baffle
3	Front Differential Carrier Baffle Bolt (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)

DRIVE SPROCKET, DRIVEN SPROCKET, AND DRIVE LINK INSTALLATION

Fig. 251: Drive Sprocket, Driven Sprocket And Drive Link

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Driven Sprocket Bearing
2	Drive Sprocket, Driven Sprocket, and Drive Link

INPUT SUN GEAR SHAFT INSTALLATION

Fig. 252: Input Sun Gear Shaft
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Variable High Clutch Housing Seal
2	Input Sun Gear Shaft
3	Input Sun Gear
4	Input Sun Gear Retaining Ring
5	Input Sun Gear Shaft Assembly
6	Input Internal Gear Thrust Bearing

FRONT DIFFERENTIAL CARRIER INSTALLATION

Fig. 253: Front Differential Carrier
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Differential Carrier Sun Gear Thrust Bearing
2	Front Differential Carrier Sun Gear
3	Front Differential Carrier
4	Front Differential Carrier Bearing

AUTOMATIC TRANSMISSION TORQUE DAMPENER AND DIFFERENTIAL HOUSING DISASSEMBLE

Front Differential Ring Gear Removal

Fig. 254: Front Differential Ring Gear
 Courtesy of GENERAL MOTORS COMPANY

Front Differential Ring Gear Removal

Callout	Component Name
Preliminary Procedure	
Use wooden blocks or equivalent to elevate the torque dampener and differential housing on the bench to protect the front wheel drive shaft oil seal.	
1	Front Differential Ring Gear Retainer
2	Front Differential Ring Gear
3	Front Differential Carrier Internal Gear Wear Ring

Input Brake Clutch Removal

Fig. 255: Input Brake Clutch

Courtesy of GENERAL MOTORS COMPANY

Input Brake Clutch Removal

Callout	Component Name
1	Input Brake Clutch Retaining Ring
2	Input Brake Clutch
3	Input Brake Clutch Retaining Ring

Input Internal Gear Removal

Fig. 256: Input Internal Gear

Courtesy of GENERAL MOTORS COMPANY

Input Internal Gear Removal

Callout	Component Name
1	Input Internal Gear Retaining Ring
2	Input Internal Gear
3	Automatic Transmission Torque Dampener Thrust Washer

Input Drive Flange Removal

Fig. 257: Input Drive Flange

Courtesy of GENERAL MOTORS COMPANY

Input Drive Flange Removal

Callout	Component Name
1	Automatic Transmission Torque Dampener Bolt (Qty: 6) Procedure Use DT-51654 holder in a vise to hold the torque dampener while removing the bolts. NOTE: DISCARD the bolts. Special Tools DT-51654 Dampener Holder For equivalent regional tools, refer to Special Tools.
2	Input Drive Flange

Automatic Transmission Torque Dampener Removal

Fig. 258: Automatic Transmission Torque Dampener

Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Torque Dampener Removal

Callout	Component Name
1	Automatic Transmission Torque Dampener
2	Automatic Transmission Torque Dampener Thrust Bearing NOTE: The thrust bearing may be stuck to the torque dampener.

Automatic Transmission Torque Dampener Bypass Clutch Piston Removal

Fig. 259: Automatic Transmission Torque Dampener Bypass Clutch Piston

Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Torque Dampener Bypass Clutch Piston Removal

Callout	Component Name
CAUTION: Refer to Seal Reuse Caution .	
1	Automatic Transmission Torque Dampener Bypass Clutch Piston Return Spring Retaining Ring
2	Automatic Transmission Torque Dampener Bypass Clutch Piston Return Spring
3	Automatic Transmission Torque Dampener Bypass Clutch Apply Bearing
4	Automatic Transmission Torque Dampener Bypass Clutch Piston NOTE: It may be necessary to apply air to the apply passage to remove the piston.
5	Automatic Transmission Torque Dampener Bypass Clutch Piston Outer Seal NOTE: DISCARD the seal.

Callout	Component Name
6	Automatic Transmission Torque Dampener Bypass Clutch Piston Inner Seal NOTE: DISCARD the seal.

FRONT WHEEL DRIVE SHAFT OIL SEAL REMOVAL - RIGHT SIDE

Fig. 260: Front Wheel Drive Shaft Oil Seal - Right Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal Special Tools • DT-23129 Universal Seal Remover • GE-6125-1B Slide Hammer For equivalent regional tools, refer to Special Tools .

INPUT SHAFT SEAL REMOVAL

Fig. 261: Input Shaft Seal

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input Shaft Seal Special Tools • DT-23129 Universal Seal Remover • GE-6125-1B Slide Hammer For equivalent regional tools, refer to Special Tools.

INPUT SHAFT BEARING REMOVAL

Fig. 262: Input Shaft Bearing

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input Shaft Bearing Procedure Use a punch and hammer to remove the bearing.

AUTOMATIC TRANSMISSION TORQUE DAMPENER AND DIFFERENTIAL HOUSING CLEANING AND INSPECTION

Fig. 263: Automatic Transmission Torque Dampener And Differential Housing

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: Do not use abrasive pads or bristle devices to clean the sealing surfaces. Abrasive pads produce a fine grit that can effect transmission function. Abrasive pads can also remove enough metal to create oil leaks.	

Callout	Component Name
CAUTION: After cleaning components, allow to air dry. Do not use cloth or paper towels in order to sit down. Any transmission damage caused by lint from the towels can cause premature component failure. 1. Thoroughly clean the torque dampener and differential housing, including case threads, with clean solvent. 2. Clean gasket sealing surfaces. Remove all residual gasket material. 3. Inspect all threaded holes. If necessary, repair any thread damage.	
1	Transmission Fluid Filler Tube Plug
2	Transmission Fluid Filler Tube Plug
3	Transmission Case to Torque Dampener and Differential Housing Sealing Surface
4	Automatic Transmission Fluid Pressure Test Hole Plug (Qty: 2)
5	Retaining Ring Grooves

INPUT SHAFT BEARING INSTALLATION

Fig. 264: Input Shaft Bearing

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input Shaft Bearing Procedure Use DT-48008 support with the small shoulder facing up to support the housing while using DT-51625-1 installer and a press to install the bearing. Special Tools • DT-48008 Press Support/Pinion Bearing Installer • DT-51625-1 Bearing Installer For equivalent regional tools, refer to Special Tools.

INPUT SHAFT SEAL INSTALLATION

Fig. 265: Input Shaft Seal

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input Shaft Seal Special Tools • DT-8092 Drive Handle • DT-51622 Seal Installer For equivalent regional tools, refer to Special Tools.

FRONT WHEEL DRIVE SHAFT OIL SEAL INSTALLATION - RIGHT SIDE

Fig. 266: Front Wheel Drive Shaft Oil Seal - Right Side

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal Special Tools • DT-46629-A Axle Seal Installer • GE-8092 Driver Handle For equivalent regional tools, refer to Special Tools.

INPUT INTERNAL GEAR ASSEMBLY OVERHAUL

Automatic Transmission Torque Limit Clutch

Fig. 267: Automatic Transmission Torque Limit Clutch

Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Torque Limit Clutch

Callout	Component Name
1	Automatic Transmission Torque Limit Clutch Backing Plate Ring
2	Automatic Transmission Torque Limit Clutch Backing Plate
3	Automatic Transmission Torque Limit Clutch Spring
4	Automatic Transmission Torque Limit Clutch Backing Plate

Input Internal Gear Hub

Fig. 268: Input Internal Gear Hub

Courtesy of GENERAL MOTORS COMPANY

Input Internal Gear Hub

Callout	Component Name
1	Input Internal Gear Retaining Ring
2	Input Internal Gear Hub
3	Input Internal Gear

AUTOMATIC TRANSMISSION TORQUE DAMPENER AND DIFFERENTIAL HOUSING ASSEMBLE

Automatic Transmission Torque Damper Bypass Clutch Piston Installation

Fig. 269: Automatic Transmission Torque Dampener Bypass Clutch Piston
 Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Torque Dampener Bypass Clutch Piston Installation

Callout	Component Name
CAUTION: Refer to Seal Reuse Caution .	
1	Automatic Transmission Torque Dampener Bypass Clutch Piston Inner Seal NOTE: Install a NEW seal.
2	Automatic Transmission Torque Dampener Bypass Clutch Piston Outer Seal NOTE: Install a NEW seal.
3	Automatic Transmission Torque Dampener Bypass Clutch Piston Procedure Align the dot on the piston to the 6 o'clock notch on the dampener and differential housing. NOTE: Lubricate the piston seals with

Callout	Component Name
	automatic transmission fluid (ATF) to aid in installation of the piston.
4	Automatic Transmission Torque Dampener Bypass Clutch Apply Bearing
5	Automatic Transmission Torque Dampener Bypass Clutch Piston Return Spring
6	Automatic Transmission Torque Dampener Bypass Clutch Piston Return Spring Retaining Ring

Automatic Transmission Torque Dampener Installation

Fig. 270: Automatic Transmission Torque Dampener

Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Torque Dampener Installation

Callout	Component Name
1	Automatic Transmission Torque Dampener Thrust Bearing
2	Automatic Transmission Torque Dampener

Input Drive Flange Installation

Fig. 271: Input Drive Flange

Courtesy of GENERAL MOTORS COMPANY

Input Drive Flange Installation

Callout	Component Name
1	Input Drive Flange
2	Automatic Transmission Torque Damper Bolt (Qty: 6) CAUTION: Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure NOTE: Install NEW bolts.

Callout	Component Name
	Use DT-51654 holder in a vise to hold the torque dampener while installing the bolts. Tighten 58 N.m (35 lb ft) +37.5 Degrees Special Tools • DT-51654 Dampener Holder • EN-45059 Angle Meter For equivalent regional tools, refer to Special Tools.

Input Internal Gear Installation

Fig. 272: Input Internal Gear
Courtesy of GENERAL MOTORS COMPANY

Input Internal Gear Installation

Callout	Component Name
1	Automatic Transmission Torque Dampener Thrust Washer - Selective Procedure Select the correct thrust washer. Refer to: Automatic Transmission Torque Dampener Thrust Washer Measurement .
2	Input Internal Gear
3	Input Internal Gear Retaining Ring

Input Brake Clutch Installation

Fig. 273: Input Brake Clutch

Courtesy of GENERAL MOTORS COMPANY

Input Brake Clutch Installation

Callout	Component Name
1	Input Brake Clutch Retaining Ring
2	Input Brake Clutch NOTE: The input brake clutch should rotate freely in one direction and lock in the opposite direction. Rotate the clutch assembly and listen/feel for the ratchet of the clutch in it's designed rotational direction.

Callout	Component Name
3	Input Brake Clutch Retaining Ring

Front Differential Ring Gear Installation

Fig. 274: Front Differential Ring Gear
 Courtesy of GENERAL MOTORS COMPANY

Front Differential Ring Gear Installation

Callout	Component Name
1	Front Differential Carrier Internal Gear Wear Ring NOTE: Inspect the dampener housing for wear before installing the wear ring. If excessive wear is found, replace the dampener housing.
2	Front Differential Ring Gear
3	Front Differential Ring Gear Retainer

Callout	Component Name
	NOTE:

Stake the retainer to ensure it is seated in the

AUTOMATIC TRANSMISSION TORQUE DAMPENER THRUST WASHER MEASUREMENT

Automatic Transmission Torque Dampener Thrust Washer Measurement (Step 1)

Fig. 275: Automatic Transmission Torque Dampener Thrust Washer Measurement (Step 1)
 Courtesy of GENERAL MOTORS COMPANY

Automatic Transmission Torque Dampener Thrust Washer Measurement (Step 1)

Callout	Component Name
	Automatic Transmission Case Mating Surface
	Procedure - Using 2 inch gauge blocks and at least a 16 inch straight edge, set up the measurement as shown. - Measure from the case mating surface to the top of the straight edge and record the measurement. - Measure from the top of the input internal gear thrust bearing to the top of the straight edge and subtract this dimension from the measurement taken in step 2. Record the measurement - Measure the thickness of the torque dampener and differential housing gasket and subtract from the measurement recorded in step 3. Record this as dimension A.

Automatic Transmission Torque Dampener Thrust Washer Measurement (Step 2)

Callout	Component Name
1	Automatic Transmission Torque Dampener Procedure 1. Apply 50 PSI of compressed air to the torque dampener bypass clutch and measure from the torque dampener and differential housing mating face to the torque dampener. Record this as dimension B. 2. Subtract dimension A from dimension B to determine the correct automatic transmission torque dampener thrust washer. Refer to Automatic Transmission Torque Dampener Thrust Washer Specifications.

**AUTOMATIC TRANSMISSION TORQUE DAMPENER AND DIFFERENTIAL HOUSING
INSTALLATION**

Fig. 277: Automatic Transmission Torque Dampener And Differential Housing With Bolt Tightening Sequences

1	Drive Motor Battery Positive and Negative Cable Connector
2	Drive Motor Battery Positive and Negative Cable Connector Bolt (Qty: 4) Tighten 9 N.m (80 lb in)

FRONT DIFFERENTIAL CARRIER FINAL ROTATIONAL TORQUE MEASUREMENT

Fig. 287: Front Differential Carrier Final Rotational Torque Measurement

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Carrier Procedure Use a dial or beam torque wrench with DT-49938 Differential Rotating Tool to measure turning torque. The rotational torque should be below 7.45 N.m (65.94 lb in) Special Tools DT-49938 Differential Rotating Tool For equivalent regional tools, refer to Special Tools.

HOLDING FIXTURE REMOVAL

Fig. 288: Holding Fixture Assembly

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Â WARNING: Handle with care, the transmission assembly weighs over 183 Kg (403 lbs). Bodily injury could occur if not handled properly. Procedure 1. Install DT-46625 Holding Fixture. 2. Remove lock pin from DT-3289-20 Holding Fixture. 3. Raise the transmission with an overhead hoist in order to remove the holding DT-46625 Transmission Holding Fixture. 4. Lower the transmission assembly onto the transmission jack. Special Tools

Callout	Component Name
	• DT-03289-20 Holding Fixture Base Assembly • DT-46625 Holding Fixture • DT-46625-20 Holding Fixture Adapters For equivalent regional tools, refer to Special Tools.

DESCRIPTION AND OPERATION

DEFINITIONS AND ABBREVIATIONS

Throttle Positions

Engine Braking

A condition where the engine is used to slow the vehicle by manually downshifting during a zero throttle coastdown.

Full Throttle Downshift

A quick apply of the accelerator pedal to its full travel, forcing a downshift.

Heavy Throttle

Approximately 3/4 of accelerator pedal travel, 75 percent throttle position.

Light Throttle

Approximately 1/4 of accelerator pedal travel, 25 percent throttle position.

Medium Throttle

Approximately 1/2 of accelerator pedal travel, 50 percent throttle position.

Minimum Throttle

The least amount of throttle opening required for an upshift.

Wide Open Throttle (WOT)

Full travel of the accelerator pedal, 100 percent throttle position.

Zero Throttle Coastdown

A full release of the accelerator pedal while the vehicle is in motion and in drive range.

Shift Condition Definitions

Bump

A sudden and forceful apply of a clutch or a band.

Chuggle

A bucking or jerking. This condition may be most noticeable when the converter clutch is engaged. It is similar to the feel of towing a trailer.

Delayed

A condition where a shift is expected but does not occur for a period of time. This could be described as a clutch or band engagement that does not occur as quickly as expected during a part throttle or wide open throttle apply of the accelerator, or during manual downshifting to a lower range. This term is also defined as LATE or EXTENDED.

Double Bump - Double Feel

Two sudden and forceful applies of a clutch or a band.

Early

A condition where the shift occurs before the car has reached proper speed. This condition tends to labor the engine after the upshift.

End Bump

A firmer feel at the end of a shift than at the start of the shift. This is also defined as END FEEL or SLIP BUMP.

Firm

A noticeably quick apply of a clutch or band that is considered normal with a medium to heavy throttle. This apply should not be confused with HARSH or ROUGH.

Flare

A quick increase in engine RPM along with a momentary loss of torque. This most generally occurs during a shift. This condition is also defined as SLIPPING.

Harsh - Rough

A more noticeable apply of a clutch or band than FIRM. This condition is considered undesirable at any throttle position.

Hunting

A repeating quick series of upshifts and downshifts that causes a noticeable change in engine RPM, such as a 4 - 3 - 4 shift pattern. This condition is also defined as BUSYNESS.

Initial Feel

A distinctly firmer feel at the start of a shift than at the finish of the shift.

Late

A shift that occurs when the engine RPM is higher than normal for a given amount of throttle.

Shudder

A repeating jerking condition similar to CHUGGLE but more severe and rapid. This condition may be most noticeable during certain ranges of vehicle speed.

Slipping

A noticeable increase in engine RPM without a vehicle speed increase. A slip usually occurs during or after initial clutch or band apply.

Soft

A slow, almost unnoticeable clutch or band apply with very little shift feel.

Surge

A repeating engine related condition of acceleration and deceleration that is less intense than CHUGGLE.

Tie-Up

A condition where two opposing clutch and/or bands are attempting to apply at the same time causing the engine to labor with a noticeable loss of engine RPM.

Noise Conditions

Drive Link Noise

A whine or growl that increases or fades with vehicle speed, and is most noticeable under a light throttle acceleration. It may also be noticeable in PARK or NEUTRAL operating ranges with the vehicle stationary.

Final Drive Noise

A hum related to vehicle speed which is most noticeable under a light throttle acceleration.

Planetary Gear Noise

A whine related to vehicle speed, which is most noticeable in FIRST gear, SECOND gear, FOURTH gear or REVERSE. The condition may become less noticeable, or go away, after an upshift.

Pump Noise

A high pitched whine that increases in intensity with engine RPM. This condition may also be noticeable in all operating ranges with the vehicle stationary or moving.

Driver Shift Control

Driver shift control (DSC) allows the driver to change gears similar to a manual transmission. Refer to the vehicle owner's manual for specific DSC operating instructions.

TRANSMISSION GENERAL DESCRIPTION

The 5ET50 is a fully automatic, front wheel drive transaxle containing an electronically-controlled continuously-

variable electric transmission. It includes an input flange, a torque dampener assembly with a rotating friction clutch, a stationary mechanical (one way) clutch, one stationary and one rotating friction clutch assemblies, a hydraulic pressurization and control system, a power inverter (and control) module, an electric fluid pump, two planetary gear sets, and two electric drive motor-generators. Drive motor-generator A (1) is 48 kW and drive motor-generator B (2) is 87 kW.

The torque damper is internal to the transmission, bolted to the input flange, and contains coil springs and a damper bypass clutch. The torque damper acts as a spring coupling to smoothly transmit shaft power from the engine to the input planetary gear set in the transmission and as a direct mechanical coupling from the transmission to the engine using the damper bypass clutch during engine starting and engine stopping.

The power inverter module is under the angled top cover and includes a control circuit board, solid-state switches, capacitors, and other electronic components. The power inverter module receives and monitors driver commands and various other electronic sensor inputs and uses this information to vary the torque and speed of each electric motor-generator and to command the engine controller and engine operation. The power inverter module is connected with each of the two drive motor-generators through three internal terminal posts for transmitting variable-frequency, high-voltage, three-phase alternating-current (AC) electricity. The power inverter module is also electrically connected with the battery pack through a high-voltage, high-power connector and cable assembly for transmitting direct-current (DC) electricity.

The hydraulic system includes a high pressure electric fluid pump driven by an electric motor supplied with high-voltage current from the power inverter module, shift solenoid valves, a variable line pressure control solenoid valve, and control wiring harness. All of the shift solenoids and the transmission fluid temperature sensor are packaged into a self-contained control solenoid valve assembly under the front cover. The electric pump maintains working pressure and control of the clutches when the engine is on and when the engine is off.

The two planetary gear sets, electric motor-generators, and other clutches together provide all-electric propulsion, continuously-variable hybrid transmission ratios, and a single fixed mechanical transmission ratio. When the vehicle is operating all-electrically, the stationary mechanical clutch reacts torque from motor-generator A to the output in the forward direction and the stationary friction clutch assembly can react torque from motor-generator B to the output. When the engine is in use, the stationary and rotating friction clutch assemblies are controlled by the power inverter module using hydraulic shift solenoids to select from a variable lower range of hybrid transmission ratios, a fixed mechanical transmission ratio, and a variable higher range of hybrid transmission ratios.

The transmission may be operated in any of the following gear ranges:

P (PARK)

This position locks the wheels and prevents the vehicle from rolling either forward or backward. PARK is the best position to use when starting the vehicle. Because the transmission utilizes a shift lock control system, it is necessary to fully depress the brake pedal before shifting out of PARK. For safety reasons, use the parking brake in addition to the PARK position.

R (REVERSE)

This position allows the vehicle to be operated in a rearward direction. There is no separate reverse clutch or gearing in the transmission. All of the torque for reverse comes from motor-generator B.

N (NEUTRAL)

In this position, the propulsion system does not provide power to the wheels.

D (DRIVE)

Drive range should be used for all normal driving conditions for maximum efficiency and fuel economy. Drive position allows the transmission to operate all-electrically using one or both motor-generators when sufficient battery power and energy are available or using the engine when the battery is not sufficient.

L (Low)

This position is used for the "feel" of engine braking and can be used for the slowing of the vehicle once the throttle is lifted. While in the position the vehicle will slow quicker and use the drive motor generator B to more aggressively collect energy during a regenerative braking event.

TRANSMISSION COMPONENT AND SYSTEM DESCRIPTION

The mechanical components of the hybrid 5ET50 Transmission are as follows:

- Input Brake Clutch (MKV Only)
- Input Drive Flange
- Input Sun Gear Shaft
- Input Carrier
- Input Internal Gear
- Drive Motor (1) and (2)
- Driven and Drive Sprocket with Drive Link Assembly
- Output Carrier Internal Gear
- Variable Low Clutch Assembly
- Variable High Clutch Assembly
- Control Valve Body Assembly
- Automatic Transmission Torque Dampener
- Front Differential Carrier

The electrical components of the 5ET50 are as follows:

- Drive Motor (1)
- Drive Motor (2)
- Fluid Pump Motor
- Output Speed Sensor
- Manual Shift Detent Lever
- Drive Motor Generator Power Inverter Module
- Drive Motor Power Inverter Module Connector

For more information, refer to [Electronic Component Description](#).

HYBRID TRANSMISSION MODES OF OPERATION

Single Motor Electric Vehicle (EV)

Single motor EV operation is used when lower torque is required. This includes reverse gear. The Internal Combustion Engine (ICE) and drive motor A (1) are OFF. The high range clutch is open and the low range

clutch is closed. Drive motor B (2) provides torque through the planetary gear set to the wheels.

Dual Motor Electric Vehicle (EV)

Dual motor EV operation is used when high torque is required at any vehicle speed. The Internal Combustion Engine (ICE) is OFF. Drive motor A (1) and drive motor B (2) are ON. The high range clutch (C2) is open and the low range clutch (C1) is closed. Drive motors A (1) and B (2) both provide torque through the planetary gear sets to the wheels.

Extended Range Low

Extended range low is used when the rechargeable energy storage system (RESS) requires charging at lower vehicle speeds. The Internal Combustion Engine (ICE) is ON. Drive motor A (1) and drive motor B (2) are ON. The low range clutch (C1) is closed, and the high range clutch (C2) is open. Drive motor A (1) is generating to charge the RESS. Drive motor B (2) provides torque through the planetary gear set to the wheels.

Extended Range Fixed Ratio

Extended range fixed ratio is used when the rechargeable energy storage system (RESS) requires charging at mid-range vehicle speeds. The Internal Combustion Engine (ICE) is ON. The ICE provides power through the planetary gear set to the wheels. Drive motor A (1) and drive motor B (2) are ON. The low range clutch (C1) is closed, and the high range clutch (C2) is closed. Drive motor B (2) can perform regeneration to charge the RESS in low torque demands or provide torque through the planetary gear set to the wheels in high torque demands.

Extended Range High

Extended range high is used when the rechargeable energy storage system (RESS) requires charging at higher vehicle speeds. The Internal Combustion Engine (ICE) is ON. The ICE provides power through the planetary gear set to the wheels. Drive motor A (1) and drive motor B (2) are ON. The low range clutch (C1) is open and the high range clutch (C2) is closed. Both drive motor A (1) and drive motor B (2) can either operate in regeneration mode to charge the RESS or provide power to the wheels.

TRANSMISSION INDICATORS AND MESSAGES

No transmission-related indicators or messages are displayed on the instrument panel cluster (IPC). For a complete listing and description of all vehicle indicators and messages, refer to Indicator/Warning Message Description and Operation.

ELECTRONIC COMPONENT DESCRIPTION

Electronic Components

The 5ET50 transmission contains the electronic components listed below:

- Automatic Transmission Fluid Pump
- Control Solenoid Valve
- Drive Motor Assembly - 1st Position
- Drive Motor Assembly - 2nd Position
- Manual Shift Detent Lever A/Trans Output Speed Sensor Assembly

This transmission is a fully automatic front wheel drive transaxle, and is an electronically-controlled continuously-

variable electric transmission. High voltage three phase circuits connect the 2 motor/generators and the electric automatic transmission fluid pump drive motor assembly, to the drive motor control modules. The high voltage electric automatic transmission fluid pump provides transmission fluid pressure.

Callout	Component Name
511	Drive Motor Rotor Bearing Retaining Ring

The drive motor generator power inverter module controls the three permanent magnet 3-phase electric motors that are internal to the transmission, and perform the following functions:

- Torque for vehicle propulsion
- Engine cranking
- Battery charging
- Regenerative Braking
- Transmission fluid pressure

The Drive Motor/Generator Description

Drive Motor Assembly (1st position) is a generator referred to as Drive Motor 1 on the scan tool and consists of a permanent magnet rotor with a distributed bar wound, NdFeB magnet stator capable of producing 55 kW of peak electrical energy and 138 N.m (102 lb ft).

Drive Motor Assembly (2nd position) is a traction motor referred to as Drive Motor 2 on the scan tool and consists of a permanent magnet rotor with a distributed bar wound, NdFeB magnet stator capable of producing 76 kW of peak electrical energy and 178 N.m (131 lb ft).

Both are actively cooled via transmission fluid. Drive Motor Assembly (1st position) is used to start the engine and maintain charge to the hybrid battery. Drive Motor Assembly (2nd position) propels the vehicle. Motor speeds are controlled and monitored by resolver-type position sensors. The drive motor position sensors are monitored by the motor control modules. The motor control modules monitor the angular position, speed and direction of the drive motor generator based upon the signals of these position sensors. The position sensor, or resolver, contains a drive coil, 2 driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At ignition ON, the motor control module outputs a low AC voltage, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the 2 driven coils and the irregular shaped rotor. The motor control module then monitors the 2 driven coil circuits for a return signal. The position of the irregular shaped metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the 2 driven coils signals allows the motor control module to determine the exact angle, speed and direction of the drive motor generator. For more information on the drive motor function and system interaction refer to [Drive Motor Power Inverter Module Description and Operation](#) .

Automatic Transmission Fluid Pump

Fig. 292: Electric Auxiliary Pump Drive Motor Assembly Components

Courtesy of GENERAL MOTORS COMPANY

The electric automatic transmission fluid pump assembly is driven by high voltage AC which is controlled by the drive motor/generator power inverter module assembly. The purpose of the auxiliary fluid pump motor is to supply oil pressure to the transmission for lube, cooling and clutch application during vehicle propulsion. The automatic transmission fluid pump motor is commanded on when the propulsion system is active.

Control Solenoid Valve

The control solenoid valve assembly contains the following components:

Control Solenoid Valve Assembly

Fig. 293: Control Solenoid Valve Assembly

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Transmission Fluid Temperature Sensor
2	Pressure Control Solenoid Valve 2
3	Pressure Control Solenoid Valve 5
4	Electrical Connector - 8 Pins
5	Pressure Control Solenoid Valve 3
6	Pressure Control Solenoid Valve 4

These components are not serviced separately. The control solenoid valve bolts directly to the valve body within the transmission. The control solenoid assembly X1 connector connects to the Automatic Transmission Wiring Harness - Control Solenoid Valve.

Line Pressure Control Solenoid Valve

The line pressure solenoid control valve is located in the H bore of the control valve body assembly. The A - H bores are stamped on the control valve body assembly in order to aid in the locating the control valve body components. The line pressure control solenoid valve is a variable force solenoid valve, this type of solenoid can increase or decrease the amount of pressurized fluid based on the amount of current applied to solenoid valve coil. The line pressure solenoid control valve is used to control transmission fluid pressure for clutch pressure, lube, and drive motor cooling.

Solenoid Characterization

The line pressure solenoid control valve is tested after assembly to determine the output fluid pressure at certain electrical current values, applied to coil windings. This information is referred to as solenoid current/pressure data points. The solenoid valves are tested two ways, with an increasing and decreasing electrical current applied to the

coil windings. The resultant current versus pressure data points are saved and assigned a file number. The file number is marked on the solenoid valve housing end. The performance data file is stored on the TIS web site. This data file is programmed and stored in the vehicle's hybrid/EV powertrain control module 1. Replacing any of the following components will require the hybrid/EV powertrain control module 1 to be programmed with the new or existing solenoid valve performance data.

- Hybrid/EV powertrain control module 1 - program the new hybrid/EV powertrain control module 1 with the existing solenoid data files stored on the TIS web site for the line pressure solenoid control valve.
- Line pressure solenoid control valve - program the hybrid/EV powertrain control module 1 with the new solenoid data file stored on the TIS web site for the line pressure solenoid control valve.
- Control valve body assembly - program the hybrid/EV powertrain control module 1 with the existing solenoid data files stored on the TIS web site for the line pressure solenoid control valve.
- Line pressure solenoid control valve and control valve body as a complete assembly - program the hybrid/EV powertrain control module 1 with the new solenoid data file stored on the TIS web site for the line pressure solenoid control valve.
- Transmission Assembly - A new transmission assembly will have the solenoid characterization data programmed into the hybrid/EV powertrain control module 1.

Fig. 294: Line Pressure Control Solenoid Valve
Courtesy of GENERAL MOTORS COMPANY

Callout	Bore	Description
1	H Bore	Line Pressure Control Solenoid Valve

Manual Shift Detent Lever

Fig. 295: Internal Mode Switch (IMS)

Courtesy of GENERAL MOTORS COMPANY

The 5 electronic switches are called the transmission range switches and are used to indicate the gear position the vehicle operator has selected. The 5 outputs (A, B, C, P, S) are range selection inputs to the hybrid/EV powertrain control module 1, through the Automatic Transmission Wiring Harness - Shift Shaft Position Switch. The manual shift detent lever assembly is mounted on the interior front of the transmission case above the control valve body assembly. The internal mode switch indicates to the hybrid/EV powertrain control module 1 which gear position the vehicle operator has selected. The Internal Mode Switch consists of 5 separate hall effect switches. Each hall effect switch is supplied a 9 V reference circuit, and a signal circuit from the hybrid/EV powertrain control module 1. Each signal circuit for each gear selector position will have either a voltage reading of 0.70 - 0.96 V indicating ON or 1.68 - 2.38 V indicating OFF. The voltage values on each Internal Mode Switch circuit will change and are dependent on the position of the gear selector. The state of each Internal Mode Switch A/B/C/P/S circuit is displayed on the scan tool.

Output Speed Sensor (OSS)

Fig. 296: Output Speed Sensor (OSS) Assembly
Courtesy of GENERAL MOTORS COMPANY

The output speed sensor assembly has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The output speed sensor mounts to the A/Trans case assembly and is connected to the hybrid/EV powertrain control module 1 through Automatic Transmission Wiring Harness - Control Solenoid Valve. The sensor faces the front differential drive pinion (w/transfer gear) gear assembly machined teeth surface. The sensor receives 8.3 - 9.3 volts on the OSS supply voltage circuit from the hybrid/EV powertrain control module 1. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The two sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the hybrid/EV powertrain control module 1 for speed and direction and is transmitted through the serial data circuits to the ECM. The ECM and hybrid/EV powertrain control module 1, compare the output speed sensor signal with the anti-lock brake system wheel speed sensor signal. The hybrid/EV powertrain control module 1 also compares the output shaft direction with the drive motor 1 and drive motor 2 direction.

PARK ENGINE OFF

When the gear selector lever is in the Park (P) position and the internal combustion engine is OFF, the fluid pump is commanded ON and line pressure is directed to the pressure regulator valve and other various components. The following steady-state conditions exist in the transmission's hydraulic and electrical systems.

Fluid Pressure Directed In Preparation For A Shift

Line Fluid Circuit

Line fluid from the automatic transmission fluid pump supplies constant fluid flow to various components such as the line pressure regulating valve, line pressure control solenoid, variable high clutch dam feed regulator valve, shift solenoid 2, shift solenoid 3, shift solenoid 4, shift solenoid 5, variable low clutch valve, variable high clutch valve and dampener bypass clutch valve. Line pressure is controlled by the HPCM by varying electrical current supplied to the line pressure control solenoid dependent on transmission operating conditions.

Variable Low Clutch Applies

Shift Solenoid 3

The shift solenoid 3 is energized ON, allowing line fluid to enter the solenoid 3 signal circuit. Solenoid 3 signal fluid is then routed to the variable low clutch valve.

Variable Low Clutch Valve

Solenoid 3 signal fluid, at the variable low clutch valve, opposes variable low clutch valve spring force to supply line fluid pressure into the variable low clutch fluid circuit.

Variable Low Clutch Assembly

Line fluid is routed through orifice #8 through the variable low clutch valve and into the variable low clutch circuit. Variable low clutch fluid passes through the variable low clutch housing and moves the variable low clutch piston against spring force to apply the variable low clutch.

Variable Low Clutch Accumulator Piston

Variable low clutch fluid is also sent to the variable low clutch accumulator piston. Variable low clutch fluid moves the variable low clutch accumulator piston against accumulator spring force to cushion apply of the variable low clutch assembly.

Torque Dampener Clutch Applies

Shift Solenoid 5

The shift solenoid 5 is energized ON, allowing line fluid to enter the solenoid 5 signal circuit. Solenoid 5 signal fluid is then routed to the dampener bypass clutch valve.

Dampener Bypass Clutch Valve

Solenoid 5 signal fluid, at the dampener bypass clutch valve, opposes dampener bypass clutch valve spring force to supply line pressure into the dampener bypass clutch circuit.

Torque Damper Assembly

Line fluid is routed through orifice #12 through the damper bypass clutch valve and into the damper bypass clutch circuit. Damper bypass clutch fluid passes through the automatic transmission case and automatic transmission torque damper and differential housing and moves the torque damper bypass clutch piston against spring force to apply the automatic transmission torque damper in preparation for an engine start.

Lube boost is available

Shift Solenoid 4

Shift solenoid 4 (Lube Boost) is commanded ON based on torque and temperature inputs to the HPCM. The shift solenoid 4 is energized ON, allowing line fluid to enter the solenoid 4 signal circuit. Solenoid 4 signal fluid is then routed through orifice #4 to the lube regulator valve elevating lube and motor cooling pressure and flow.

Park Engine Off

Fig. 297: Park Engine Off - Hydraulic Flow Diagram
 Courtesy of GENERAL MOTORS COMPANY

PARK ENGINE ON

If the HPCM determines that operating conditions (low state of battery charge, low temperature) are appropriate for the internal combustion engine (ICE) to be ON in Park, the fluid pump is commanded ON and line pressure is directed to the pressure regulator valve and other various components. The following steady-state conditions exist in the transmission's hydraulic electrical systems. Note that the torque damper assembly is commanded ON only during the start sequence and is OFF once the ICE is ON.

Fluid Pressure Directed in Preparation for a Shift

Line Fluid Circuit

Line fluid from the automatic transmission fluid pump supplies constant fluid flow to various components such as the line pressure regulating valve, line pressure control solenoid, variable high clutch dam feed regulator valve, shift solenoid 2, shift solenoid 3, shift solenoid 4, shift solenoid 5, variable low clutch valve, variable high clutch valve and dampener bypass clutch valve. Line pressure is controlled by the HPCM by varying electrical current supplied to the line pressure control solenoid dependent on transmission operating conditions.

Variable Low Clutch Applies

Shift Solenoid 3

The shift solenoid 3 is energized ON, allowing line fluid to enter the Solenoid 3 signal circuit. Solenoid 3 signal fluid is then routed to the variable low clutch valve.

Variable Low Clutch Valve

Solenoid 3 signal fluid, at the variable low clutch valve, opposes variable low clutch valve spring force to supply line fluid pressure into the variable low clutch fluid circuit.

Variable Low Clutch Assembly

Line fluid is routed through orifice #8 through the variable low clutch valve and into the variable low clutch circuit. Variable low clutch fluid passes through the variable low clutch housing and moves the variable low clutch piston against spring force to apply the variable low clutch.

Variable Low Clutch Accumulator Piston

Variable low clutch fluid is also sent to the variable low clutch accumulator piston. Variable low clutch fluid moves the variable low clutch accumulator piston against accumulator spring force to cushion apply of the variable low clutch assembly.

Lube Boost Is Available

Shift Solenoid 4

Shift solenoid 4 (Lube Boost) is commanded ON based on torque and temperature inputs to the HPCM. The shift solenoid 4 is energized ON, allowing line fluid to enter the Solenoid 4 signal circuit. Solenoid 4 signal fluid is then routed through orifice #4 to the lube regulator valve elevating lube and motor cooling pressure and flow.

Park Engine ON

Fig. 298: Park Engine ON - Hydraulic Flow Diagram

Courtesy of GENERAL MOTORS COMPANY

NEUTRAL ENGINE OFF

When the gear selector lever is in the Neutral (N) position and the internal combustion engine is OFF, the fluid pump is commanded ON and line pressure is directed to the pressure regulator valve and other various components. If Neutral is selected after the vehicle was operating in Reverse EV Mode or Drive Single Motor EV Mode, the variable low clutch releases and the torque damper clutch stays applied.

Fluid Pressure Directed In Preparation For A Shift

Line Fluid Circuit

Line fluid from the automatic transmission fluid pump supplies constant fluid flow to various components such as the line pressure regulating valve, line pressure control solenoid, variable high clutch dam feed regulator valve, shift solenoid 2, shift solenoid 3, shift solenoid 4, shift solenoid 5, variable low clutch valve, variable high clutch valve and dampener bypass clutch valve. Line pressure is controlled by the HPCM by varying electrical current supplied to the line pressure control solenoid dependent on transmission operating conditions.

Variable Low Clutch Releases

Shift Solenoid 3

The shift solenoid 3 is commanded OFF, allowing Solenoid 3 signal fluid to exhaust from the variable low clutch valve.

Variable Low Clutch Valve

Variable low clutch valve spring force moves the variable low clutch valve to the released position, allowing variable low clutch accumulator fluid and variable low clutch pressure to exhaust.

Variable Low Clutch Accumulator Piston

Variable low clutch fluid pressure is exhausted from the variable low clutch accumulator piston. Accumulator spring force moves the variable low clutch piston accumulator to the released position.

Variable Low Clutch Assembly

Variable low clutch fluid pressure is exhausted from the clutch assembly, allowing variable low clutch spring force to move the variable low clutch to the OFF position.

Torque Dampener Clutch Applies

Shift Solenoid 5

The shift solenoid 5 is energized ON, allowing line fluid to enter the solenoid 5 signal circuit. Solenoid 5 signal fluid is then routed to the dampener bypass clutch valve.

Dampener Bypass Clutch Valve

Solenoid 5 signal fluid, at the damper bypass clutch valve, opposes damper bypass clutch valve spring force to supply line fluid pressure into the damper bypass clutch fluid circuit.

Torque Damper Assembly

Line fluid is routed through orifice #12 through the damper bypass clutch valve and into the damper bypass clutch circuit. Damper bypass clutch fluid passes through the automatic transmission case and automatic transmission torque damper and differential housing and moves the torque damper bypass clutch piston against spring force to

apply the automatic transmission torque damper in preparation for an engine start.

Lube Boost Is Available

Shift Solenoid 4

Shift solenoid 4 (Lube Boost) is commanded ON based on torque and temperature inputs to the HPCM. The shift solenoid 4 is energized ON, allowing line fluid to enter the solenoid 4 signal circuit. Solenoid 4 signal fluid is then routed through orifice #4 to the lube regulator valve elevating lube and motor cooling pressure and flow.

Neutral Engine Off

Fig. 299: Neutral Engine Off - Hydraulic Flow Diagram

Courtesy of GENERAL MOTORS COMPANY

REVERSE EV MODE ENGINE OFF

When the gear selector lever is moved to the Reverse (R) position (from the Park position), and the internal combustion engine (ICE) is OFF, the following steady-state conditions exist in the transmission's hydraulic and electrical systems.

Fluid Pressure Directed In Preparation For A Shift

Line Fluid Circuit

Line fluid from the automatic transmission fluid pump supplies constant fluid flow to various components such as the line pressure regulating valve, line pressure control solenoid, variable high clutch dam feed regulator valve, shift solenoid 2, shift solenoid 3, shift solenoid 4, shift solenoid 5, variable low clutch valve, variable high clutch valve and dampener bypass clutch valve. Line pressure is controlled by the HPCM by varying electrical current supplied to the line pressure control solenoid dependent on transmission operating conditions.

Variable Low Clutch Applied

Shift Solenoid 3

The shift solenoid 3 is energized ON, allowing line fluid to enter the Solenoid 3 signal circuit. Solenoid 3 signal fluid is then routed to the variable low clutch valve.

Variable Low Clutch Valve

Solenoid 3 signal fluid, at the variable low clutch valve, opposes variable low clutch valve spring force to supply line fluid pressure into the variable low clutch fluid circuit.

Variable Low Clutch Assembly

Line fluid is routed through orifice #8 through the variable low clutch valve and into the variable low clutch circuit. Variable low clutch fluid passes through the variable low clutch housing and moves the variable low clutch piston against spring force to apply the variable low clutch.

Variable Low Clutch Accumulator Piston

Variable low clutch fluid is also sent to the variable low clutch accumulator piston. Variable low clutch fluid moves the variable low clutch accumulator piston against accumulator spring force to cushion apply of the variable low clutch assembly.

Torque Dampener Clutch Applied

Shift Solenoid 5

The shift solenoid 5 is energized ON, allowing line fluid to enter the Solenoid 5 signal circuit. Solenoid 5 signal fluid is then routed to the dampener bypass clutch valve.

Dampener Bypass Clutch Valve

Solenoid 5 signal fluid, at the dampener bypass clutch valve, opposes dampener bypass clutch valve spring force to supply line fluid pressure into the dampener bypass clutch fluid circuit.

Torque Damper Assembly

Line fluid is routed through orifice #12 through the damper bypass clutch valve and into the damper bypass clutch circuit. Damper bypass clutch fluid passes through the automatic transmission case and automatic transmission torque damper and differential housing and moves the torque damper bypass clutch piston against spring force to apply the automatic transmission torque damper in preparation for an engine start.

Lube Boost Is Available

Shift Solenoid 4

Shift solenoid 4 (Lube Boost) is commanded ON based on torque and temperature inputs to the HPCM. When required, shift solenoid 4 is energized ON, allowing line fluid to enter the solenoid 4 signal circuit. Solenoid 4 signal fluid is then routed through orifice #4 to the lube regulator valve elevating lube and motor cooling pressure and flow.

Reverse EV Mode Engine Off

Fig. 300: Reverse EV Mode Engine Off - Hydraulic Flow Diagram
 Courtesy of GENERAL MOTORS COMPANY

DRIVE SINGLE OR DUAL MOTOR EV ENGINE OFF

When the gear selector lever is in the Drive (D) position and the internal combustion engine (ICE) is OFF, the fluid pump is commanded ON and line pressure is directed to the pressure regulator valve and other various components. The following steady-state conditions exist in the transmission's hydraulic and electrical systems. If Drive (D) was selected after the vehicle was operating in Reverse EV Mode or Park (Engine off), the variable low clutch and the torque damper clutch stay applied.

Fluid Pressure Directed In Preparation For A Shift

Line Fluid Circuit

Line fluid from the automatic transmission fluid pump supplies constant fluid flow to various components such as the line pressure regulating valve, line pressure control solenoid, variable high clutch dam feed regulator valve, shift solenoid 2, shift solenoid 3, shift solenoid 4, shift solenoid 5, variable low clutch valve, variable high clutch valve and dampener bypass clutch valve. Line pressure is controlled by the HPCM by varying electrical current supplied to the line pressure control solenoid dependent on transmission operating conditions.

Variable Low Clutch Applied

Shift Solenoid 3

The shift solenoid 3 is energized ON, allowing line fluid to enter the solenoid 3 signal circuit. Solenoid 3 signal fluid is then routed to the variable low clutch valve.

Variable Low Clutch Valve

Solenoid 3 signal fluid, at the variable low clutch valve, opposes variable low clutch valve spring force to supply line fluid pressure into the variable low clutch fluid circuit.

Variable Low Clutch Accumulator Piston

Variable low clutch fluid is also sent to the variable low clutch accumulator piston. Variable low clutch fluid moves the variable low clutch accumulator piston against accumulator spring force to cushion apply of the variable low clutch assembly.

Variable Low Clutch Assembly

Line fluid is routed through orifice #8 through the variable low clutch valve and into the variable low clutch circuit. Variable low clutch fluid passes through the variable low clutch housing and moves the variable low clutch piston against spring force to apply the variable low clutch.

Torque Dampener Clutch Applied

Shift Solenoid 5

The shift solenoid 5 is energized ON, allowing line fluid to enter the solenoid 5 signal circuit. Solenoid 5 signal fluid is then routed to the dampener bypass clutch valve.

Dampener Bypass Clutch Valve

Solenoid 5 signal fluid, at the damper bypass clutch valve, opposes damper bypass clutch valve spring force to supply line fluid pressure into the damper bypass clutch fluid circuit.

Torque Damper Assembly

Line fluid is routed through orifice #12 through the damper bypass clutch valve and into the damper bypass clutch circuit. Damper bypass clutch fluid passes through the automatic transmission case and automatic transmission torque damper and differential housing and moves the torque damper bypass clutch piston against spring force to apply the automatic transmission torque damper in preparation for an engine start.

Lube Boost Is Available

Shift Solenoid 4

Shift solenoid 4 (Lube Boost) is commanded ON based on torque and temperature inputs to the HPCM. When required, shift solenoid 4 is energized ON, allowing line fluid to enter the solenoid 4 signal circuit. Solenoid 4 signal fluid is then routed through orifice #4 to the lube regulator valve elevating lube and motor cooling pressure and flow.

Drive Single or Dual Motor EV Engine Off

Fig. 301: Drive Single Or Dual Motor EV Engine Off - Hydraulic Flow Diagram

Courtesy of GENERAL MOTORS COMPANY

DRIVE EXTENDED RANGE LOW ENGINE ON

When the gear selector lever is in the Drive (D) position and the HPCM determines that operating conditions are appropriate, the internal combustion engine (ICE) is started, the main fluid pump provides hydraulic fluid pressure. If Drive (D) is selected after the vehicle was operating in Reverse EV Mode or Park (Engine off), the variable low clutch stays applied. After Engine Start, the following changes would occur to the transmission's hydraulic and electrical systems in order to start the vehicle moving from a stopped position.

Torque Dampener Clutch Releases

Shift Solenoid 5

The shift solenoid 5 is commanded OFF, allowing Solenoid 5 signal fluid to exhaust from the dampener bypass clutch valve.

Dampener Bypass Clutch Valve

Dampener bypass clutch valve spring force moves the dampener bypass clutch valve to the released position, allowing dampener bypass clutch fluid pressure to exhaust.

Torque Dampener Assembly

Dampener bypass clutch fluid exhausts from the torque dampener clutch assembly through the dampener bypass clutch valve allowing the torque dampener clutch to release.

Drive Extended Range Low Engine On

Fig. 302: Drive Extended Range Low Engine On - Hydraulic Flow Diagram

Courtesy of GENERAL MOTORS COMPANY

DRIVE EXTENDED RANGE HIGH ENGINE ON

When the gear selector lever is in the Drive (D) position and the HPCM determines that operating conditions are appropriate, the internal combustion engine (ICE) is started, the main fluid pump provides hydraulic fluid pressure. If the transmission is operating in extended range fixed gear ratio and the HPCM determines that operating conditions are appropriate for a shift to extended range high, the following changes would occur to the transmission's hydraulic and electrical systems.

Variable Low Clutch Releases

Shift Solenoid 3

The shift solenoid 3 is commanded OFF, allowing Solenoid 3 signal fluid to exhaust from the variable low clutch valve.

Variable Low Clutch Valve

Variable low clutch valve spring force moves the variable low clutch valve to the released position, allowing variable low clutch accumulator fluid pressure to exhaust.

Variable Low Clutch Accumulator Piston

Variable low clutch fluid pressure is exhausted from the variable low clutch accumulator piston. Accumulator spring force moves the variable low clutch piston accumulator to the released position.

Variable Low Clutch Assembly

Variable low clutch fluid pressure is exhausted from the clutch assembly, allowing variable low clutch spring force to move the variable low clutch to the OFF position.

Drive Extended Range High Engine On

Fig. 303: Drive Extended Range High Engine On - Hydraulic Flow Diagram

Courtesy of GENERAL MOTORS COMPANY

DRIVE EXTENDED RANGE FIXED RATIO ENGINE ON

When the gear selector lever is in the Drive (D) position and the HPCM determines that operating conditions are appropriate, the internal combustion engine (ICE) is started, the main fluid pump provides hydraulic fluid pressure. If the transmission is operating in extended range low (mode 1) and the HPCM determines that operating conditions are appropriate for a shift to extended range fixed ratio, the following changes would occur to the transmission's hydraulic and electrical systems.

Variable High Clutch Applies

Shift Solenoid 2

The shift solenoid 2 is energized ON, allowing line fluid to enter the Solenoid 2 signal circuit. Solenoid 2 signal fluid is then routed to the variable high clutch valve.

Variable High Clutch Valve

Solenoid 2 signal fluid, at the variable high clutch valve, opposes variable high clutch valve spring force to supply line fluid pressure into the variable high clutch fluid circuit. This also allows compensator feed fluid to exhaust through the variable high clutch valve exhausting the variable high clutch dam.

Variable High Clutch Assembly

Line fluid is routed through orifice #9 through the variable high clutch valve and into the variable high clutch fluid circuit. Variable high clutch fluid passes through the transmission case and variable high clutch housing and moves the variable high clutch piston against spring force to apply the variable high clutch.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B270A: PARK LOCK SOLENOID CONTROL CIRCUIT SHORT TO BATTERY/GROUND

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B270A 01

Park Lock Solenoid Control Circuit Short to Battery

DTC B270A 02

Park Lock Solenoid Control Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuse B+	B270A 01, 1	B270A 01, 1	-	-
Control	B270A 02, 1	1	B270A 01, 2	-
Ground	-	1	-	-
1. Transmission shift lever will not move from PARK with the brake pedal applied. 2. Transmission shift lever will move from PARK without the brake pedal applied.				

Circuit/System Description

The body control module (BCM) controls the transmission shift lock control solenoid actuator by providing a battery positive voltage to the solenoid when the brake pedal is applied. The BCM monitors the voltage and current flow of the control circuit.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- The brake pedal is applied.
- The transmission is in the PARK position.
- The DTC runs continuously once the above conditions are met.

Conditions for Setting the DTC

B270A 01

The body control module detects a short to voltage in the transmission shift lock control solenoid actuator control circuit for 1 s.

B270A 02

The body control module detects a short to ground in the transmission shift lock control solenoid actuator control circuit for 1 s.

Action Taken When the DTC Sets

The body control module will not attempt to enable the voltage supply circuit of the automatic transmission park lock control solenoid until the next power switch cycle.

Conditions for Clearing the DTC

- A current DTC B270A will clear when the malfunction is no longer present and the power switch is cycled.
- A history DTC will clear after 100 ignition cycles with no current DTC active during the 100 power switch cycles.

- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Brake Transmission Shift Interlock Solenoid Actuator Command parameter changes from Inactive to Active when the brake pedal is applied.
 - **If the Brake Transmission Shift Interlock Solenoid Actuator Command does not change**
Refer to [Stop Lamps Malfunction](#)
 - **If the Brake Transmission Shift Interlock Solenoid Actuator Command changes**
3. Verify the S3 Transmission Shift Lever moves out of the PARK position when the brake pedal is applied.
 - **If the S3 Transmission Shift Lever does not move out of the PARK position**
Refer to Circuit/System Testing.
 - **If the S3 Transmission Shift Lever does move out of the PARK position**
All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, Vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Disconnect the harness connector at the S3 Transmission Shift Lever.
 4. Test for infinite resistance between the control circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S3 Transmission Shift Lever.
 - **If the test lamp illuminates**
3. Vehicle OFF and all vehicle systems OFF, connect the X1 harness connector at the K9 Body Control Module. Disconnect the harness connector at the S3 Transmission Shift Lever. It may take up to 2 minutes for all vehicle systems to power down.
4. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
5. Vehicle in Service Mode, connect a test lamp between the control circuit terminal 4 and the ground circuit terminal 2.
6. Verify the test lamp turns ON and OFF when commanding the Brake Transmission Shift Interlock Solenoid Actuator ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, remove the test lamp, disconnect the X7 harness connector at the K9 Body Control Module, Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

7. Test or replace the S3 Transmission Shift Lever.

Component Testing

1. Install a 10 A fused jumper wire between the control terminal 4 and 12 V. Momentarily install a jumper wire between the ground terminal 2 and ground.
2. Verify the solenoid turns on & off/clicks, etc.

- **If the solenoid does not turn on & off/clicks, etc.**

Replace the S3 Transmission Shift Lever.

- **If the solenoid does turn on & off/clicks, etc.**

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Transmission Control Replacement (With Base) Transmission Control Replacement (Without Base)**
- **Control Module References** for control module replacement, programming, and setup.

SYMPTOMS - AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Automatic Transmission Shift Lock Control Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the automatic transmission shift lock control. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#)

Symptom List

Refer to a symptom diagnostic procedure in order to diagnose the symptom:

[Transmission Control Lever Malfunction](#)

TRANSMISSION CONTROL LEVER MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

- If infinite resistance, replace the S3 Transmission Shift Lever.

- **If the test lamp illuminates**

3. Vehicle OFF and all vehicle systems OFF, connect the X1 harness connector at the K9 Body Control Module. Disconnect the harness connector at the S3 Transmission Shift Lever. It may take up to 2 minutes for all vehicle systems to power down.

4. Test for less than 10 Ω between the ground circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

5. Vehicle in Service Mode, connect a test lamp between the control circuit terminal 4 and the ground circuit terminal 2.

6. Verify the test lamp turns ON and OFF when commanding the Brake Transmission Shift Interlock Solenoid Actuator ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, remove the test lamp, disconnect the X7 harness connector at the K9 Body Control Module.

2. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit
- If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, remove the test lamp, disconnect the X7 harness connector at the K9 Body Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

7. Test or replace the S3 Transmission Shift Lever.

Component Testing

1. Install a 10 A fused jumper wire between the control terminal 4 and 12 V. Momentarily install a jumper wire between the ground terminal 2 and ground.

2. Verify the solenoid turns on & off/clicks, etc.

- **If the solenoid does not turn on & off/clicks, etc.**

Replace the S3 Transmission Shift Lever.

- **If the solenoid does turn on & off/clicks, etc.**

3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Transmission Control Replacement \(With Base\)](#) [Transmission Control Replacement \(Without Base\)](#)
- [Control Module References](#) for control module replacement, programming, and setup.

DESCRIPTION AND OPERATION

AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL DESCRIPTION AND OPERATION

The automatic transmission park lock control system is a safety device that prevents an inadvertent shift out of PARK. The driver must press the brake pedal before moving the park lever out of the PARK position. The system consists of the following components:

- The automatic transmission park lock solenoid (serviced as the automatic transmission shift lock actuator), is located within the floor shift control assembly.
- The body control module, which controls the voltage supply circuit of the park lock control solenoid.
- The engine control module.

The body control module controls the voltage to the park lock control solenoid through the park lock control solenoid controlled voltage circuit. The following conditions must be met before the body control module will supply voltage to the park lock solenoid:

- The ignition is in the ON position.
- The engine control module sends an input via GMLAN serial data to the body control module indicating the transmission is in the PARK position.
- The body control module determines the brake pedal is applied according the brake pedal position.

Since the park lock control solenoid is permanently grounded, the body control module supplies voltage to the automatic transmission park lock control solenoid, unlocking the park lever allowing the driver to move the park lever out of the PARK position as the solenoid energizes. When the brake pedal is not applied, the body control module turns the control voltage output of the park lock control solenoid OFF, de-energizing the park lock control solenoid. The de-energized solenoid mechanically locks the park lever in the PARK position.

DIAGNOSTIC INFORMATION AND PROCEDURES

TRANSMISSION OVERHEATS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Cause	DTCs
Engine:	
• Engine coolant level low • Engine Overheating • Incorrect engine coolant • Old coolant or incorrect concentration level • Cooling system leak • Radiator hose kinked or pinched • Loose, missing, or damaged radiator air seals or deflector - restricted air flow • The radiator and air conditioning condenser has air flow obstructions to include large amount of bent fins • The cooling fans do not operate • Inspect the engine mechanical for worn, leaking, cracked cylinder heads, or engine block	-
Transmission:	
Vehicle Overload or Beyond Capacity Towing: • Vehicle is overloaded • Vehicle is towing beyond capacity. This vehicle is neither designed nor intended to tow a trailer or another vehicle. • Vehicle modifications	-
Heat Transfer: • Engine overheating • Cooler restrictions - transmission fluid auxiliary cooler restricted flow or blockage • Restricted air flow • Vehicle modifications • Aftermarket auxiliary cooler installed incorrectly, incorrect flow direction - reversed flow • Restricted, blocked, or pinched transmission cooler lines • Stuck closed transmission thermal bypass valve	-
Transmission Abuse: • Vehicle overloaded • Vehicle is towing beyond capacity. This vehicle is neither designed nor intended to tow a trailer or another vehicle. • Vehicle modifications	-

Cause	DTCs
Vehicle Damage: • Transmission oil cooler pipe kinked, pinched or restricted • Restricted air flow	-
Transmission Fluid: • Fluid leaks • Low fluid level • Contaminated or poor transmission fluid quality	P079A P079B
Low Fluid Pump Output: • Low fluid level • Blocked, damaged or loose filter • Pinched or restricted cooler lines • Restricted cooler - damage or debris • Inefficient pump - worn	-
Clutch Slippage: • Low fluid level • Low fluid pump output • Damaged or leaking clutch seals • Internal hydraulic leak • Worn clutch plate assembly	P079A P079B

Circuit/System Description

The primary source of heat in the 5ET50 transmission is the drive motors. The drive motors are cooled by the transmission fluid. Hot fluid exits the drive motors and flows to the transmission oil cooler through the transmission cooler supply line and thermal bypass valve. The thermal bypass valve assembly is located near the lower left side of the radiator. The cooled fluid returns to the transmission through the transmission fluid cooler pipe assembly and cools the control solenoid assembly. The transmission fluid temperature sensor is located in the control solenoid assembly and is not serviced separately. The Transmission Fluid Temperature parameter on the scan tool should rise steadily to a normal operating temperature, and then stabilize.

The thermal bypass valve is mechanically operated, based on the oil temperature of the transmission in order to maintain optimum transmission operating efficiency. The valve has an activating temperature of 82°C (176°F), with the range to move being 78 - 83°C (172 - 181°F). The full open temperature is 96°C (205°F). The thermal bypass valve assembly begins to open at 82°C (176°F) for optimum transmission operation and fuel economy. The valve has a typical oil flow rate of 9 - 10 lpm (2.4 - 2.6 gpm).

Cold Mode:

82Â°C (176Â°F) and below the thermal bypass valve bypasses the oil going to the cooler and sends the fluid back to the transmission.

Mixing Mode:

82 - 96Â°C (176 - 205Â°F) the thermal bypass valve is in mixing mode - some of the fluid flows back to the trans and some flows through the transmission oil cooler.

Hot Mode:

Above 96Â°C (205Â°F) The thermal bypass valve is fully open and transmission oil flows through the cooler then back to the transmission.

- [Park Engine On](#)

Description and Operation

- [Transmission General Description](#)
- [Transmission Indicators and Messages](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Special Tools

- **DT-24731** Tempil Stick
- **DT-45096** Transmission Oil Cooler System Flush and Flow Test Tool

For equivalent regional tools, refer to [Special Tools](#) .

Component Testing

1. Perform the [Fluid Leak Diagnosis](#) .
2. Verify airflow through the radiator is not obstructed. Refer to [Radiator Cleaning](#) .
3. Perform the [Transmission Fluid Level and Condition Check](#) procedure.
4. Perform the [Line Pressure Check](#) procedure.
5. Perform the [Automatic Transmission Fluid Pump Pressure High or Low](#) procedure.
6. Perform the [Transmission Fluid Cooler Flow Test and Flushing](#).
7. With a hand held or infra red thermometer or **DT-24731** tempil stick, test for the transmission cooler supply line thermal bypass valve assembly opening at 96Â°C (205Â°F). The transmission cooler supply line temperature should be higher on the transmission side of the thermal bypass valve assembly than the cooler side until 96Â°C (205Â°F) is reached.

- **If the thermal bypass valve tests stuck closed**

Replace the thermal bypass valve assembly.

- **If the thermal bypass valve tests normal**

Inspect the transmission oil passages for a blockage.

- **If passages are blocked**

Repair as necessary.

- **If passages are not blocked**

8. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Transmission Fluid Auxiliary Cooler Replacement**
- **Transmission Fluid Cooler Thermal Bypass Valve Replacement**
- **Transmission Fluid Cooler Inlet Pipe Replacement**
- **Transmission Fluid Cooler Outlet Pipe Replacement**

TRANSMISSION FLUID COOLER FLOW TEST AND FLUSHING

GM studies indicate that plugged or restricted transmission oil coolers and pipes cause insufficient transmission lubrication and elevated operating temperatures which can lead to premature transmission failure. Many repeat repair cases could have been prevented by following published procedures for transmission oil cooler flushing and flow checking. This procedure includes flow checking and flushing the auxiliary transmission oil cooler, if equipped.

NOTE: Use the DT-45096 transmission oil cooling system flush and flow test tool to flush and flow test the transmission oil cooler and the oil cooler pipes after the transmission is removed for repairs.

Only use the appropriate GM automatic transmission fluid when doing a repair on a GM transmission.

If the fluid in the **DT - 45096** transmission oil cooling system flush and flow test tool is different than what is used in the transmission, after performing the flush and flow test, use compressed air to blow the residual transmission fluid out of the oil cooler and lines.

Time allowance for performing the cooler flow checking and flushing procedure has been included in the appropriate labor time guide operations since the 1987 model year. The service procedure steps for oil cooler flushing and flow testing are as follows:

Cooler Flow Check and Flushing Steps

1. Machine Set-up
2. Determine Minimum Flow Rate

3. Back Flush
4. Forward Flush
5. Flow Test
6. Code Recording Procedure
7. Clean-up

Special Tools

- **DT-45096** Transmission Oil Cooling System Flush and Flow Test Tool
- **DT-45096-50** Transmission Cooler Flush Adapter
- **DT-45096-55** Transmission Cooler Flush Adapter
- Shop air supply with water/oil filters, regulator and pressure gauge - minimum 90 psi
- Eye protection
- Rubber gloves

For equivalent regional tools, refer to [Special Tools](#).

Machine Set-up

Fig. 1: View Of Main Power Switch & Main Function Switch
Courtesy of GENERAL MOTORS COMPANY

1. Verify that the main power switch (1) is in the OFF position.
2. Place the main function switch (2) in the IDLE position.

Fig. 2: Connecting To 12V DC Power Source

Courtesy of GENERAL MOTORS COMPANY

3. Connect **DT 45096** flush and flow test tool to the vehicle 12V DC power source by connecting the red battery clip to the positive, +, battery post on the vehicle and connect the negative lead to a known good chassis ground.
4. Turn the main power switch to the ON position.

Fig. 3: Filling Supply Tank With Transmission Fluid

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not overfill the supply vessel. Damage to the unit may result. To verify the fluid level, view the LCD screen display while filling the unit, to ensure the fluid level does not exceed 30 L (32 qt).

5. Fill the supply tank with the appropriate GM automatic transmission fluid through the fill port.
6. Reinstall and tighten the fill cap.

Fig. 4: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

7. Connect a shop air supply hose to the quick-disconnect on the rear panel marked SUPPLY AIR.

Determine Minimum Flow Rate

Fig. 5: Identifying Machine Display Of Automatic Transmission Fluid Temperature
Courtesy of GENERAL MOTORS COMPANY

1. From the machine display, identify the temperature of the automatic transmission fluid that is stored in the supply vessel of **DT 45096** flush and flow test tool.

Fig. 6: Identifying Transmission Oil Cooler Metal Composition

Courtesy of GENERAL MOTORS COMPANY

2. Determine whether the transmission oil cooler is steel or aluminum by using a magnet (1) at the cooler flange (2) at the radiator.
3. Refer to the table below. Using the temperature from step 1, locate on either the Steel MINIMUM Flow Rate table or the Aluminum MINIMUM Flow Rate table the minimum flow rate in gallons per minutes (GPM). Record the minimum flow rate in GPMs and the supply fluid temperature for further reference.

Example

- Fluid temperature: 75°F
- Cooler Type: Steel

The MINIMUM flow rate for this example would be 0.8 GPM.

4. Inspect transmission oil cooler lines for damage or kinks that could cause restricted oil flow. Repair as needed and refer to the appropriate GM service manual procedures.

Minimum Flow Rate in Gallons Per Minute (gpm)

Temperature Range	Steel	Aluminum
65 - 66°F	0.6 gpm	0.5 gpm
67 - 70°F	0.7 gpm	0.6 gpm
71 - 75°F	0.8 gpm	0.7 gpm
76 - 80°F	0.9 gpm	0.8 gpm
81 - 84°F	1.0 gpm	0.9 gpm
85 - 89°F	1.1 gpm	1.0 gpm
90 - 94°F	1.2 gpm	1.1 gpm
95 - 98°F	1.3 gpm	1.2 gpm
99 - 103°F	1.4 gpm	1.3 gpm
104 - 108°F	1.5 gpm	1.4 gpm
109 - 112°F	1.6 gpm	1.5 gpm
113 - 117°F	1.7 gpm	1.6 gpm
118 - 120°F	1.8 gpm	1.7 gpm

Bypass Valve Removal

Fig. 7: Fluid Cooler Bypass Valve

Courtesy of GENERAL MOTORS COMPANY

1. Remove the fluid cooler bypass valve. Refer to [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#).
2. Install the **DT 45096-55** cooler flush adapter.

Back Flush Procedure

Fig. 8: Cooler Flush Adapter

Courtesy of GENERAL MOTORS COMPANY

1. Connect the **DT 45096-50** flush adapter (1) to the vehicle transmission oil cooler supply and return lines at the transmission.

Fig. 9: View Of Black Supply Hose And Clear Waste Hose
Courtesy of GENERAL MOTORS COMPANY

2. Connect the black supply hose (1) to the return line, top connector of the transmission, and the clear waste hose (2) to the feed line, bottom connector of the transmission, to the vehicle cooler lines. This is the reverse flow - backflush direction.

Fig. 10: View Of Main Function Switch FLUSH Position

Courtesy of GENERAL MOTORS COMPANY

3. Turn the main function switch to the FLUSH position. Allow the machine to operate for 30 seconds.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

IDLE

FLUID 16 QTS @ 075F

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 11: View Of Main Function Switch IDLE Position

Courtesy of GENERAL MOTORS COMPANY

4. Turn the main function switch to the IDLE position and allow the supply vessel pressure to dissipate.

Forward Flush

Fig. 12: Identifying Supply And Waste Hoses
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the supply and waste hoses from the vehicle cooler lines. Reverse the supply and waste hoses to provide a normal flow direction.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

FLUSH

FLUID 18 QTS

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 13: View Of Main Function Switch FLUSH Position

Courtesy of GENERAL MOTORS COMPANY

2. Turn the main function switch to the FLUSH position and allow machine to operate for 30 seconds.

Flow Test

Fig. 14: View Of Main Function Switch FLOW Position

Courtesy of GENERAL MOTORS COMPANY

NOTE: If the flow rate is less than 0.5 gpm, the LCD displays an error message. Refer to the Troubleshooting section of the operation manual.

1. Turn the main function switch to the FLOW position and allow the oil to flow for 15 seconds. Observe and note the flow rate; this is the TESTED flow rate.
2. Compare the TESTED flow rate to the MINIMUM flow rate information previously recorded.
 - If the TESTED flow rate is equal to or greater than the MINIMUM flow rate recorded, the oil cooling system is functioning properly. Perform Code Recording Procedure.
 - If the TESTED flow rate is less than the MINIMUM flow rate previously recorded, repeat the back flush and forward flush procedures.
3. If the TESTED flow rate is less than the MINIMUM flow rate after the second test, perform Code Recording Procedure.
 1. Replace the transmission oil cooler.

2. Reconnect supply and waste hoses to the cooler lines in the normal flow direction. Perform Flow Test.
3. Perform Code Recording Procedure.

Code Recording Procedure

Fig. 15: View Of Main Function Switch CODE Position

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- If power is interrupted prior to the recording of the seven-character code, the code will be lost and the flow rate test will need to be repeated.
- The flow test must run for a minimum of 8-10 seconds and be above 0.5 GPM for a code to be generated.

1. Turn the main function switch to the CODE position.
2. Record TESTED flow rate, temperature, cycle and seven-character flow code information on repair order.

Fig. 16: View Of Main Power Switch & Main Function Switch

Courtesy of GENERAL MOTORS COMPANY

1. Turn the main function switch (2) to the IDLE position and allow the supply vessel pressure to dissipate.
2. Turn the main power switch (1) to the OFF position.

NOTE:

- A small amount of water may drain from the bottom of the unit when the air supply is disconnected. This is a normal operation of the built-in water separator.
- If the fluid in the DT-45096 transmission oil cooling system flush and flow test tool is different than what is used in the transmission, use compressed air to blow the residual transmission fluid out of the oil cooler and lines.

3. Disconnect the supply and waste hoses and the 12-volt power source from the vehicle.

Fig. 17: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the air supply hose from **DT-45096** flush and flow test tool.
5. Remove **DT-45096-55** cooler flush adapter and install the fluid cooler bypass valve.
6. Remove **DT-45096-50** adapters.
7. Attach cooler lines to the transmission.
8. Dispose of the waste automatic transmission fluid in accordance with all applicable federal, state, and local requirements.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - WHEEL DRIVE SHAFTS

IMPORTANT: Complete the following steps prior to beginning the wheel drive shaft diagnosis.

1. Review the [Vibration Diagnosis, Starting Point, and Correction](#) .
2. Perform the [Vibration Analysis - Road Testing \(EL-38792-A Electronic Vibration Analyzer\) Vibration Analysis - Road Testing \(CH-51450-NVH Oscilloscope\)](#) in order to effectively diagnose the concern.
3. Review the system operation in order to become familiar with the system function. Refer to [Wheel Drive Shafts Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket equipment and modifications which could affect the operation of the wheel drive shafts or other rotating components.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Thoroughly inspect the entire wheel drive shaft for visible damage, leaking joint seals, and missing seal clamps.
- Inspect the wheel drive shaft seals for cuts, tears, or other damage which may allow the loss of lubricant and the entry of contaminants.

Symptom List

After performing the Visual/Physical Inspection and no visual signs of damage or other interference impairing the wheel drive shaft function is apparent, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the joints manually. Any binding or otherwise impeded movement of the joints may indicate damage which could contribute to the concern. Refer to the following:

- [Click Noise In Turns](#)
- [Clunk When Accelerating from Coast](#)
- [Clunk Noise When Accelerating During Turns](#)
- [Shudder or Vibration During Acceleration](#)

CLICK NOISE IN TURNS

A click noise occurring during turns may be caused by a worn or damaged wheel drive shaft outer joint. This may be more apparent while simultaneously turning and accelerating. This click is caused by wear and/or damage to the constant velocity joint bearings and/or races. Commonly, this damage or wear is caused by the loss of lubricating grease from the constant velocity joint and the entry of foreign material or contaminants.

Carefully inspect the wheel drive shaft seals for cuts, tears or other damage which may allow the lubricating grease to escape. The loss of this grease will cause damage to the wheel drive shaft constant velocity joint in a very short period of time.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the outer joint manually. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

CLUNK WHEN ACCELERATING FROM COAST

A clunk noise occurring when accelerating from coast or a standing start may be caused by a worn or damaged wheel drive shaft inner joint. The common cause of wheel drive shaft inner joint damage is the loss of lubricating grease and/or the presence of foreign material and contaminants in the joint. This usually occurs as a result of a torn or damaged inner joint seal.

Carefully inspect the wheel drive shaft seal for cuts, tears or other damage that may allow the loss of the lubricating grease and/or the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the inner joint manually. Do not allow the joint to separate from the wheel drive shaft bar. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

CLUNK NOISE WHEN ACCELERATING DURING TURNS

A clunk noise that occurs while accelerating during turns may be caused by wear and/or damage to the inboard and the outboard joints in combination. The loss of lubricant and/or the presence of contaminants can cause damage to the internal components of the joints.

Carefully inspect the joint seals for cuts, tears or other damage. Joint seals that are damaged may allow lubricant leakage and the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the joints manually. Do not allow the joints to separate from the wheel drive shaft bar. Any binding or impeded movement of the joints may indicate damage which could contribute to the concern.

SHUDDER OR VIBRATION DURING ACCELERATION

In order to diagnose a shudder or vibration during acceleration, refer to [Vibration Diagnosis, Starting Point, and Correction](#) .

REPAIR INSTRUCTIONS

FRONT WHEEL DRIVE SHAFT REPLACEMENT

Special Tools

- **CH-28733-B** Wheel Hub and Driveshaft Remover
- **DT-51504** Seal Protector

15. Remove Wheel Drive Shaft (1) @ Vehicle

Fig. 6: Axle Shaft Retaining Ring

Courtesy of GENERAL MOTORS COMPANY

16. DISCARD the retaining ring.

Fig. 7: Wheel Drive Shaft And Washer

Courtesy of GENERAL MOTORS COMPANY

NOTE: If there is no washer on the wheel drive shaft, install a NEW washer.

17. Remove and DISCARD the washer (1) from the front wheel drive shaft (2).

Installation Procedure

Fig. 8: Axle Shaft Retaining Ring

Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW retaining ring to the front wheel drive shaft inner joint. Start to pull the ring from the front wheel drive shaft inner joint end down to the ring groove.

Fig. 9: Differential Output Shaft Seal Protector

Courtesy of GENERAL MOTORS COMPANY

CAUTION: DT-6332/DT-51504 or equivalent must be installed into the front wheel drive shaft oil seal prior to removing and installing the front wheel drive shaft. Failure to use the DT-6332/DT-51504 may cause the spline of the front wheel drive shaft to cut the front wheel drive shaft oil seal. Damage to the front wheel drive shaft oil seal will result in lubricant leaks.

2. Install the **DT-51504** protector (1) into the differential.

Fig. 10: Wheel Drive Shaft

Courtesy of GENERAL MOTORS COMPANY

3. Install the wheel drive shaft into the differential until the retaining ring is fully seated. (1)
4. With the aide of an assistant, move the front knuckle assembly into the proper position.
5. Install the wheel drive shaft in the front wheel hub.
6. Install the lower control arm ball joint to the steering knuckle. Refer to [Steering Knuckle Replacement](#) .
7. Connect the outer tie rod to the steering knuckle. Refer to [Steering Linkage Outer Tie Rod Replacement](#) .
8. Install Stabilizer Shaft Link. Refer to [Stabilizer Shaft Link Replacement](#)

Fig. 11: Wheel Drive Shaft Nut

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT tighten.

9. Loosely install Wheel Drive Shaft Nut (1)

Fig. 12: Holding Brake Rotor From Turning Using Drift
Courtesy of GENERAL MOTORS COMPANY

10. Insert a drift or a punch (1) in the brake cooling fin.
11. Rotate the brake rotor until the drift or the punch is rest against the brake caliper mounting bracket.
12. Tighten Wheel Drive Shaft Nut
 1. First Pass: 150 N.m (111 lb ft)
 2. Second Pass: - Loosen 45 degrees, use the **EN-45059** meter
 3. Final Pass: 250 N.m (184 lb ft)
13. Install Front Wheelhouse Liner. Refer to [**Front Wheelhouse Liner Replacement \(Left Side\)**](#) [**Front Wheelhouse Liner Replacement \(Right Side\)**](#)
14. Install Front Compartment Splash Shield. Refer to [**Front Compartment Splash Shield Replacement**](#)
15. Install the front tire and wheel assemblies. Refer to [**Tire and Wheel Removal and Installation**](#) .
16. Lower the vehicle.

DESCRIPTION AND OPERATION

WHEEL DRIVE SHAFTS DESCRIPTION AND OPERATION

Front wheel drive axles are flexible assemblies.

Front wheel drive axles consist of the following components:

- A front wheel drive shaft tripot joint (inner joint)
- A front wheel drive shaft constant velocity joint (outer joint)
- A front wheel drive shaft

The front wheel drive shaft connects the front wheel drive shaft tripot joint and the front wheel drive shaft constant velocity joint.

The front wheel drive shaft tripot joint is completely flexible. The front wheel drive shaft tripot joint can move in and out.

The front wheel drive shaft constant velocity joint is flexible, but the front wheel drive shaft constant velocity joint cannot move in and out.

Boots And Clamps

The front wheel drive shaft constant velocity joint and the front wheel drive shaft tripot joint boots in the front wheel drive axle are made of a thermoplastic material.

The clamps in the front wheel drive axle are made of stainless steel.

The boot provides the following functions:

- Protection of the internal parts of the front wheel drive shaft constant velocity joint and the front wheel drive shaft tripot joint

The boot protects the grease from the following sources of damage:

- Harmful atmospheric conditions, such as extreme temperatures or ozone gas
- Foreign material, such as dirt or water
- Allows angular movement and the axial movement of the front wheel drive shaft tripot joint
- Allows angular movement of the front wheel drive shaft constant velocity joint

NOTE: Protect the boots from sharp tools and from the sharp edges of the surrounding components. Any damage to the boots or the clamps will result in leakage. Leakage will allow water to leak into the front wheel drive shaft tripot joint and the front wheel drive shaft constant velocity joints. Leakage will also allow grease to leak out of the front wheel drive shaft tripot joints and the front wheel drive shaft constant velocity joints. Leakage may cause noisy front wheel drive axle operation and eventual failure of the internal components.

The clamps provide a leak proof connection for the front wheel drive shaft tripot joint and the front wheel drive shaft constant velocity joint at the following locations:

- The housing
- The front wheel drive shaft

The thermoplastic material performs well under normal conditions and normal operation. However, the material is not strong enough to withstand the following conditions:

- Abusive handling
- Damage from sharp objects, such as sharp tools or any sharp edges of the surrounding components in the vehicle

Front Wheel Drive Shaft Tripot Joint (Inner Joint)

The front wheel drive shaft tri-pot joint is made with the tripot design without an over-extension limitation retainer.

The joint is constructed as follows for vehicles that are equipped with an automatic transmission:

- The left front wheel drive axle has a female spline. The female spline installs over a stub shaft that protrudes from the transaxle.
- The right front wheel drive axle has a female spline. The right front wheel drive axle uses barrel type snap rings in order to interlock with the intermediate shaft.

Front Wheel Drive Shaft Constant Velocity Joint (Outer Joint)

The front wheel drive shaft constant velocity joint is made with the Rzeppa joint design.

The shaft end (which mates with the knuckle/hub) has a helical spline. The helical spline ensures a tight, press-type fit.

This design prevents end play between the hub bearing and the front wheel drive axle.

GENERAL INFORMATION

Using Wiring Diagrams

INTRODUCTION

Obtains wiring diagrams and technical service bulletins, containing wiring diagram changes, from the domestic and import manufacturers. These are checked for accuracy and are all redrawn into a consistent format for easy use. All system wiring diagrams are available in color format and may be viewed and or printed in color or black and white, depending on your program settings and available printer hardware.

In the past, when cars were simpler, diagrams were simpler. All components were connected by wires, and diagrams seldom exceeded 4 pages in length. Today, some wiring diagrams require more than 16 pages. It would be impractical to expect a service technician to trace a wire from page 1 across every page to page 16.

Removing some of the wiring maze reduces eyestrain and time wasted searching across several pages. Today, the majority of diagrams follow a much improved format, which permits space for internal switch details, and component and ground locations.

Components shown with a dashed line instead of a solid line indicate not all circuits are shown in this particular diagram (circuits shown in system diagrams are typically applicable to that system only). The remaining circuits connected to that component will be shown in the appropriate system that they apply to.

Today, the wiring diagram necessary to support a given repair procedure is included within that article or a link is provided to the appropriate SYSTEM WIRING DIAGRAM article. For example, the wiring diagram for a Ford EEC-IV system may be included in ENGINE PERFORMANCE and WIRING DIAGRAMS articles for Ford Motor Co. The wiring diagram for a cruise control system may be included in ACCESSORIES & EQUIPMENT section for the specific vehicle manufacturer, and the wiring diagram for an anti-lock brake system may be included in BRAKES and WIRING DIAGRAMS for the specific manufacturer.

WIRING DIAGRAMS contains all wiring diagrams not included in STARTING & CHARGING SYSTEMS and ACCESSORIES & EQUIPMENT. This includes: Data Link Connectors, Ground Distribution, Power Distribution, Engine Performance, Electric Cooling Fans, Anti-Lock Brakes, Electronic Suspension and Electronic Steering wiring diagrams. The Data Link Connectors wiring diagrams show the circuits by which the various on-board computers exchange information, and the diagnostic connectors used for diagnosis and their location. The Ground Distribution wiring diagrams show all vehicle ground points, their location, and the components common to those ground points. The Power Distribution wiring diagrams show the power feed circuits and the components common to those power feeds.

Wiring diagrams used to support the information in ACCESSORIES & EQUIPMENT are drawn in a "top-down" format. The diagrams are drawn with the power source at the top of the diagram and the ground point at the bottom of the diagram. Component locations are identified on the wiring diagrams. Any wires that do not connect directly to a component are identified on the diagram to indicate where they go.

WIRING DIAGRAM SYMBOLS

NOTE: Standard wiring symbols are used on all wiring diagrams. The list below will help clarify any symbols that are not easily understood at a glance. Most components are labeled "Motor", "Switch" or "Relay" in addition to being drawn with the standard symbol.

G50E03637

Fig. 1: Identifying Standard Wiring Diagram Symbols

WIRING DIAGRAM GROUND NUMBER LOCATIONS

NOTE: The following illustration depicts standardized ground numbers and locations to be used in conjunction with wiring diagrams applying to 2001 and prior model years only. See [Fig. 2](#). Wiring diagrams applying to newer

model years depict manufacturer-specified ground numbers and locations. Do not utilize the illustration with 2002 and newer model year wiring diagrams.

G00027307

Fig. 2: Ground Numbers & Locations (2001 & Prior Model Years)

WIRING DIAGRAM COMPONENT LOCATIONS

When trying to locate a component in a wiring diagram and you don't know the specific system where it is located, use this handy component locator to find the system wiring diagram in which the component is located.

Then, go to that system and locate the component within the wiring diagram.

For example, if you don't know the specific system in which the ignition switch is located, look up ignition switch in the wiring diagram component location tables and go to the appropriate wiring diagram(s) which contain either full or partial views of the ignition switch. The full view of the ignition switch is located in Power Distribution.

The first listing for the component will be the full or most complete view of the component. Additional listings will be partial views of the component. Not all components are used on all models.

All components will have a partial view in Ground Distribution and Power Distribution. Data Link Connectors show connecting circuits between modules. Alternate names for components may be listed in wiring diagram component locations tables.

Ignition Key Lock Cylinder	Anti-Theft System
Ignition Module	Engine Performance
Ignition Switch	Power Distribution; Engine Performance; Generators & Regulators; Starters
Illuminated Entry Module	Illumination/Interior Lights
Illumination Lights	Illumination/Interior Lights
Impact Sensor	Air Bag Restraint System
Inertia Fuel Shutoff Switch	Engine Performance
Inhibit Relay	Starters
Instrument Cluster	Analog Instrument Panels
Intake Air Temperature (IAT) Sensor	Engine Performance
Interior Lights	Illumination/Interior Lights
Interlock Switch	Starters
Junction Block	Power Distribution
Keyless Entry Receiver	Remote Keyless Entry

Component	Wiring Diagram
Key Reminder Switch	Starters
Knock Sensor	Engine Performance
Lamp Control Module	Exterior Lights
License Plate Lamp	Exterior Lights
Lighting Control Module	Lighting Control Modules; Anti-Theft System; Daytime Running Lights; Headlight Systems
Lower Relay	Power Convertible Top
Malfunction Indicator Light (MIL)	Engine Performance; Instrument Panels
Manifold Absolute Pressure (MAP) Sensor	Engine Performance
Mass Airflow (MAF) Sensor	Engine Performance
Mega Fuse	Generators & Regulators
Memory Seat/Mirror Module	Memory Systems
Mirror Defogger	Rear Window Defogger
Moon Roof Motor	Power Moon Roof
Moon Roof Relay	Power Moon Roof
Multi-Function Control Module	Warning Systems
Neutral Safety Switch	Starters
Oil Level Switch	Engine Performance
Oil Pressure Switch/Sending Unit	Analog Instrument Panels; Engine Performance
Overhead Console	Overhead Console
Oxygen Sensor(s) (O2S)	Engine Performance
Parking Brake Switch	Analog Instrument Panels
Park Lights	Exterior Lights
Park/Neutral Position Switch	Starters; Engine Performance; Anti-Theft System; Body Control Module
Perimeter Lighting Control Relay	Exterior Lights
Power Amplifier	Power Antennas
Power Antenna Module	Power Antennas
Power Antenna Motor	Power Antennas
Power Distribution Center	Power Distribution; Generators & Regulators; Starters
Power Door Lock Motors	Power Door Locks
Power Mirror Motors	Power Mirrors; Memory Systems
Power Sliding Door Controller	Power Sliding Side Door
Power Seat Motors	Power Seats; Memory Systems
Power Steering Pressure Switch	Engine Performance
Power Top Motor	Power Convertible Top
Power Top Relay(s)	Power Convertible Top
Powertrain Control Module	Engine Performance; Analog Instrument Panels; Cruise Control Systems; Data Link Connectors; Generators & Regulators; Starters

Component	Wiring Diagram
Power Window Motors	Power Windows
Power Window Relay(s)	Power Windows
Radiator Fan Motor(s)	Electric Cooling Fans
Radiator Fan Relay(s)	Engine Performance; Electric Cooling Fans;
Rainsense Module	Wiper/Washer Systems
Raise Relay	Power Convertible Top
Remote Anti-Theft Personality (RAP) Module	Anti-Theft System; Starters; Warning Systems
Seat Belt Pretensioners	Air Bag Restraint System
Seat Belt Retractor Solenoid	Passive Restraints
Seat Belt Switch	Air Bag Restraint System; Passive Restraints
Shift Interlock Solenoid	Shift Interlock Systems
Shift Lock Actuator	Shift Interlock Systems
Side Marker Lights	Exterior Lights
SIR Coil Assembly (Clockspring)	Air Bag Restraint System
Slip Ring (Clockspring)	Air Bag Restraint System; Steering Column Switches
SRS Control Module	Air Bag Restraint System
Starter Motor	Starters
Starter Interrupt Relay	Starters
Starter Solenoid	Starters
Starter Relay	Starters
Steering Wheel Position Sensor	Anti-Lock Brakes
Stoplights	Exterior Lights
Stoplight Switch	Engine Performance; Cruise Control Systems; Anti- Lock Brakes
Sun Roof ECU	Power Sun Roof
Sun Roof Motor	Power Sun Roof
Sun Roof Position Sensor	Power Sun Roof
Taillights	Exterior Lights
Throttle Position (TP) Sensor	Engine Performance
Torque Converter Clutch Solenoid/Switch	Engine Performance
Traction Control Switch	Anti-Lock Brakes
Trailer Tow Connector	Exterior Lights
Trailer Tow Relay	Exterior Lights
Transmission/Transaxle	Engine Performance
Transmission Control Module (TCM)	Engine Performance; Starters
Transmission Range Sensor	Starters; Back-Up Lights; Engine Performance
Transmission Range Switch	Back-Up Lights; Engine Performance; Anti-Theft System
Turn Signal Flasher	Exterior Lights
Turn Signal Lights	Exterior Lights

Component	Wiring Diagram
Twilight Sentinel Switch	Headlight Systems; Daytime Running Lights
Vapor Canister Leak Detection Pump	Engine Performance
Vehicle Control Module (VCM)	Engine Performance
Vehicle Dynamic Module	Electronic Suspension
Vehicle Speed Control Servo	Cruise Control Systems
Vehicle Speed Sensor	Data Link Connectors; Analog Instrument Panels; Cruise Control Systems; Electronic Suspension
Voltage Regulator	Generators & Regulators
Water-In-Fuel Sensor	Engine Performance; Analog Instrument Panels
Wheel Speed Sensors	Anti-Lock Brakes
Window Timer Module	Power Convertible Top
Windshield Intermittent Wiper Relay	Wiper/Washer Systems
Windshield Washer Motor	Wiper/Washer Systems
Wiper Motor	Wiper/Washer Systems
